## Foreword

Organ procurement is a deciding factor in the number and success rate of organ transplants. It is an open secret that Chinese regime has been harvesting organs from executed prisoners. Trips to the execution grounds to remove organs from executed prisoners are routine operation for medical personnel in China. However, because of the inferior health condition of executed prisoners, the extracted organs are not of high quality, thus organ transplantation in China had been limited. China's former vice Minister of Health, Huang Jiefu, also admitted that the number of executed prisoners has been decreasing every year<sup>[1]</sup>. Started in 2000, however, rapidly increasing numbers of organs were extracted for transplant by hospitals of all sizes throughout the country. In the meantime, there was an increase in medical research papers about organ extraction and transplantation published in various Chinese medical journals. These papers provide details about organ transplantation and extraction, which Chinese officials' public speeches and state-run media failed to provide.

The series of investigative reports and evidence collected by WOIPFG, independent investigative report *Bloody Harvest* (2006) by Canadian Human Rights lawyer David Matas and former Canadian Secretary of State David Kilgour, *State Organs: Transplant Abuse in China* (2012) by internationally renowned medical professionals, and *The Slaughter* (2014) by author Ethan Gutmann, all reached the same conclusion that the main source of transplant organs in China since 2000 have been captive Falun Gong practitioners. China's explosive increase of organ transplant surgeries coincides with the Chinese regime's genocidal persecution of Falun Gong. The above mentioned investigative reports proved, from various angles, that China's "thriving" transplantation industry has been entirely built upon the persecution of Falun Gong.

WOIPFG analyzed over 300 medical research papers from over 200 hospitals in 31 provinces and municipalities in China. We have discovered that the descriptions about "donors" sex, age, health condition and cause of death, the procedure of organ removal, the data on organ's warm ischemia time and cold ischemia time, and the timing when transplantations were conducted, prove the existence of large organ "donors" banks consisting of living persons. This new set of evidence also strengthens the previous conclusion of harvesting organs from living persons by the Chinese regime is real, and that very large numbers of captive and healthy Falun Gong practitioners were kept as living "donors." From 2000 to 2008, in particular, huge numbers of Falun Gong practitioners were killed on demand for their organs.

The medical papers obtained by WOIPFG are mostly published between 2000 and 2012. Not every organ extraction and organ transplant is published; especially those failed operations were not even recorded. Besides, the research papers collected by WOIPFG are only a small portion of all published papers. What is presented in this investigative report is still the tip of the iceberg.

Alongside this report, WOIPFG also releases the first batch of names of medical personnel, whose involvements in the live organ harvesting are being investigated.

## 1. Brain Death, a justification to describe “donors” when organs were extracted

WOIPFG analyzed a number of medical papers and discovered the majority of the papers use “brain death donors” when referring to the person whose organs were extracted. When performed under the rule and regulations, taking organs from brain-dead donors is widely recognized and legalized internationally. However, China has no brain death legislation, nor a functioning organ donation system. Therefore, the concept of “brain-dead donors” does not legally exist in China.

### 1.1 Brain Death vs. Cardiac Death

Death is traditionally defined as the heart stops beating, the breathing stops and the blood circulation stops. It is referred to as the cardiac death. Brain death refers to complete and irreversible loss of brain function.

China lacks the state issued official guidelines to diagnose brain death. In 2003, the Ministry of Health drafted “Brain Death Determination Criteria (Adult) (The Exposure Draft)” and “Brain Death Determination Technical Specifications (Adult) (The Exposure Draft).” They were published in Chinese Medical Journal (CMJ) and other major Chinese medical publications.

In 2009, the Ministry of Health revised the two documents and issued “Brain Death Determination Criteria (Adult) (Revised)” and “Brain Death Determination Technical Specifications (Adult) (Revised)”<sup>[2]</sup>.

In March 2012, the Ministry of Health (now changed name to National Health and Family Planning Commission of PRC) assigned Xuanwu Hospital of Capital Medical University (in Beijing) as the Brain Injury Quality Control Evaluation Center. In 2013, the Center further revised and combined the two documents into “Brain Death Determination Criteria and Technical Specification (Adult Quality Control Version).” It was published in Chinese Journal of Neurology<sup>[3]</sup>.

Strictly speaking, this Criteria and Technical Specification is merely a suggested medical standard. It is not even an administrative regulation, not to mention having any legal bindings. The official website of the National Health and Family Planning Commission does not have this Specification listed in its policy and regulation section. The Brain Injury Quality Control Evaluation Center is not listed as an affiliated member of the National Health and Family Planning Commission<sup>[4]</sup>. The document specifies three criteria of brain death, which are deep (irreversible) coma, absence of brain stem reflexes, and absence of spontaneous respirations.

### 1.2 Most Organs Harvested from Cardiac Death Cases are Not Transplantable

Warm Ischemia Time is the period of time from a donor’s death to perfusion of the organ. Cold solutions are used in order to preserve the organ after removal and prior to transplantation. Cold Ischemia Time is the period of time from perfusion to transplantation<sup>[5]</sup>. The cold ischemia time could include time to transport the organ, selection of recipient, and the actual time of the transplant surgery.

Organs with prolonged Warm Ischemia Time are not transplantable. In case of death in an accident, it is most difficult to control the Warm Ischemia Time. In mainland China, medical personnel go to the execution grounds to retrieve organs from prisoners is to ensure the Warm Ischemia Time is short. If the bodies of executed prisoners were to be transported to the hospital to have their organs harvested, the Warm Ischemia Time would be too long and the organs would not be transplantable.

Chinese transplantation field has been facing the dilemma that cadaveric organs are not transplantable, and that there is no legally binding documents on the diagnosis of brain death. Director of Zhejiang Province Ningbo City Transplant Center, Lu Caide was quoted in an article saying, “Our country’s definition of death is cardiac death. But when the heart fails, the lung will follow. These 2 organs require very short Warm Ischemia Time, and the transplantation surgery itself is very complicated<sup>[6]</sup>.”

Director of the Kidney Transplant Center at Beijing Chaoyang Hospital, Zhang Xiaodong said, “When the heart stops beating, the circulation stops. This causes organs to fail. Even if people agree to donate organs after death, the organs would not be useful because of prolonged Warm Ischemia Time. The tolerable Warm Ischemia Time for different organs are, heart: 3-4min; liver: 5-8min; Kidney: 30min; cornea: 24hours. If a person is considered dead at the time of brain death, then the heart, lung, kidneys and liver would not be damaged and are transplantable[7].”

Taking organs from living donors results in short Warm Ischemia Time. The organ most commonly given by a living donor is the kidney. The Warm Ischemia Time can be as short as zero minute.

### 1.3 Harvesting Organs from Brain Dead Persons is Illegal, According to Chinese Law

On May 4, 2004, Ministry of Health issued a statement. It states that brain death is one way to define death by the medical community, and it differs from the currently adopted standard and definition. It also states that without proper laws and regulations in place, establishing the criteria for diagnosis and technical specifications of brain death does not mean diagnosing brain death is legal[8].

On Aug. 13, 2005, Xinhua published an article saying that among countries capable of transplantation, China is the only country without brain death regulation[9]. An Aug. 22, 2014 article on qq.com titled “No brain death regulation in China, 90% of doctors are not clear about the specifications either” says there are 80 countries in the world that have brain death regulations, but not China[10].

In 2004, Chen Zhonghua, director of the Institute of Organ Transplantations at Tongji Hospital, Wuhan city, Hubei province, published a paper about brain death[11]. Chen wrote, “Primary brain death is very rare. It is caused by traumatic brain injury and intracranial lesions. On an average, there are about 95 cases of traumatic brain injuries in every 100,000 people. Among the 95 cases, some would die before reaching the hospital. Some would receive treatment in the hospital, and could have 3 possible outcomes: (1) survived; (2) cardiac death; (3) brain damaged, but heart beat and breathing can be maintained by ventilator and drugs. Only the 3<sup>rd</sup> outcome is eligible for brain death diagnosis, if they were voluntary organ donors. Therefore, the ‘brain-dead donors’ are extremely rare.” Chen continues to say that “in America, 72 out of 1 million

Tel: 001-347-448-5790  
Fax: 001-347-402-1444

persons are organ donors eligible for brain death diagnose for transplant purposes.” In China, “brain-dead donors” simply do not exist.

However, in Chinese medical papers, “brain-dead donors” is commonly used to describe the organ sources. They could come from the 95 cases out of 100,000 people described in Chen Zhonghua’s paper, but only a very limited amount. Then, there must be another group of “donors” who were labeled “brain-dead.” This group of people is the main source of organs in China. Based on the annual transplant numbers in China, this must be a very large group of people.

In his paper, Chen admits that China has no brain death regulation. But he also presented an argument, namely, because China has no regulation to either legalize or ban brain death diagnosis, therefore, using organs from brain dead persons is, “strictly speaking, not illegal.”

Using the same logic, China does not ban harvesting organs from prisoners of conscience, so harvesting organs from prisoners of conscience is, strictly speaking, not illegal? In addition, Chen’s claim is against the Ministry of Health statement issued in 2004.

As of Sept. 2014 when this report was written, China still has no brain death regulation. Therefore, harvesting organs from brain dead persons is illegal in China. Even if China announces the regulation in the future, it cannot negate the illegality of all organ harvesting activities before the regulation is enacted.

## 2 Intubation Time Indicates the “Donor” was not Brain Dead

As described earlier, the three criteria of brain death are deep (irreversible) coma, absence of brain stem reflexes and absence of spontaneous breathing. The apnea test must be performed to determine the existence of spontaneous breathing or lack of it. Apnea test requires turning off the ventilator for 8 to 10 minutes.

That is to say, to be diagnosed brain dead, one must have already been connected to a ventilator through intubation. But in many Chinese medical research papers, the procedure of organ removal starts with intubation, after the diagnosis of brain death. Here are some examples.

### 2.1 First Affiliated Hospital Sun Yat-Sen University: Intubation after Brain Death

In the 2 combined heart lung transplantation performed in 2006 at the First Affiliated Hospital, Sun Yat-Sen University, the “donors were both male, ages 28 and 32, both were **diagnosed brain-dead**, no cardiovascular diseases, and no infectious diseases[12].”

**2.2.1 麻醉术前处理 为缩短供心肺的取血时间，巡回护士快速开放静脉通道，将供体体位摆好(平卧位，两上肢分别置于供体两旁)并固定妥当。协助麻醉医生进行支纤镜检查后进行气管插管。**

The steps to remove the heart and lung began with “anesthesia preoperative treatment.” It reads:

2.2.1 Anesthesia preoperative treatment: In order to decrease the Warm Ischemia Time of heart and lung, the nurse quickly opens up the venous passage, put the donor’s body in place (lie flat on back, upper limbs secured on the sides). The nurse helps the anesthetist to perform branch fiber endoscopy and then intubation.

Mail address:

www.upholdjustice.org  
Tel: 001-347-448-5790  
Fax: 001-347-402-1444

If the “male donors” were “both diagnosed brain dead,” then they must have had intubation and ventilators connected. But the procedure described above suggests that at the time of diagnosed “brain death,” the “donors” were not intubated.

## 2.2 Jiangsu Province Zhenjiang No.1 People’s Hospital: Intubation After Acute Brain Death

A research paper described 4 heart transplants performed at Zhenjiang No.1 People’s Hospital from April 2005 to December 2006. “The donors were all male, ages 23 to 40, acute brain death donors[13].”

**1.2 供体 供体均为男性, 年龄 23~40 岁, 均为急性脑死亡患者。既往无心、肺疾病史及胸部手术史。3 例体重与受体相仿, 1 例 <20%。血型: 3 例供体受体血型相同, 另一例受体为 A 型, 供体为 O 型, 供受体 HLA 的配型不作为常规。**

The first step was to “rapidly perform intubation after acute brain death, suck out the secretions from the respiratory tract, and ventilate with pure oxygen.”

**1.3.1 供体心脏切取 急性脑死亡后紧急气管插管, 吸尽呼吸道分泌物, 纯氧通气。经胸骨正中切**

## 2.3 Yunnan Province Kunming Yan’an Hospital: Intubation after Brain Death

Kunming Yan’an Hospital’s paper (submission date: Jan. 2013) described 7 heart transplants performed since April 2003. All 7 “donors” were “male brain-dead donors who agreed to donate organs before death[14].”

**70%, 肺动脉收缩压 25 ~ 150 mmHg. 7 例供体均为生前同意捐献遗体的男性脑死亡者, 年龄 22 ~ 45 岁, 供、受体之间 ABO 配型一致。**

The Chinese regime’s official media reported the “first brain-dead voluntary organ donor” in July 2006[15]. The research paper said that the 7 heart transplants were performed as early as April 2003. How did Yan’an Hospital in Kunming, Yunnan province find “brain-dead voluntary organ donors” since 2003?

The paper’s submission date was Jan. 2013, when the regime was boosting the ‘effectiveness’ of the new donation system. Very likely, ‘agreed to donate’ became the new set phrase in medical papers.

The procedure to remove all 7 hearts started with “intubation after brain death”.

#### 1.4 供心的心肌保护

供体脑死亡后插入气管导管人工通气，同时快速开胸，自主动脉根部注入肝素 3 mg/kg 后阻断升主动脉，于主动脉根部灌注 4 °C St.Thomas 液 500 ~ 1 000 mL，使其迅速停搏，并于心脏表面放

#### 2.4 Fujian Medical University Affiliated Xiehe Hospital: Intubation after Brain Death

A research paper described 4 combined heart lung transplantations performed at Fujian Medical University Affiliated Xiehe Hospital between Dec. 2004 and early 2007. The procedure of heart-lung removal states, “all donors were brain dead, apply intubation, cut open the chest, heparinize, and remove the pericardium ...[\[16\]](#)”

#### 2.5 Nanjing Military Region Fuzhou General Hospital: Intubation after Brain Death

A paper from Nanjing Military Region Fuzhou General Hospital described 5 heart transplants performed since April 2004. “The 5 donors were male. After brain death, they were intubated to maintain breathing and circulation, they were heparinized, then the aorta was cut...[\[17\]](#)”

1.2 供心保护方法 5例供体均为青年男性。脑死亡后气管插管辅助呼吸并维持循环稳定，全身肝素化后(3mg/kg)，阻断主动脉，重力灌注 4 CHTK 液 1 800 ~ 2 000ml，心表面放置冰屑，此时迅速切断下腔静脉、右肺上静脉，然后依次切断其余肺静脉、上腔静脉、肺动脉、主动脉。切取下来的心脏放入盛有 4 C 盐水的多层无菌塑料袋中，密封后置入冰盒中迅速运送至手术室。4例供心经长途运送者(2.5~3.5小时)与受体吻合前经主动脉根部再次灌注 4 CHTK 液 1 000ml。

The few examples here show the first step of removing organs was to pronounce someone “brain-dead” without performing the apnea test, which requires intubation and a ventilator. The intubation happened after the person was pronounced “brain-

Fax: 001-347-402-1444

dead". This shows that "brain death" is merely an excuse, while the "donor" was very likely alive at the time of organ removal.

### **3 Cause of Death Analysis Shows Most Donors were Alive at the Time of Organ Removal**

#### **3.1 Extremely Low Donation Numbers in China**

According to Family Health Newspaper, a subsidiary of China's state-run Heilongjiang Daily, the number of "citizens donation after death" was zero in 2003, 22 in 2006 and "as of Nov. 20, 2008, the number finally reached 104<sup>[18]</sup>." According to China Red Cross, from March 2010 to March 2012, the Organ Donation Trial Project only persuaded 207 people to donate their organs after they die. Most of them were from poor rural areas, and 90% of the potential donors or their family members asked to be "financially compensated<sup>[19]</sup>."

The donation number in China is too small to be considered as a source of organs in transplantation in China. In Chinese medical papers, "donor" is a very commonly used word. "Voluntary donation" is occasionally used. Along with "brain death", these words have lost their original meanings.

#### **3.2 Over Half of the "Donor" Cause of Death was "Brain Death"**

WOIPFG analyzed the causes of "donors' death" described in 100 Chinese medical research papers. The organs extracted included hearts, lungs, livers, kidneys, and corneas. There are 6 different causes of death as described: "brain death," "traumatic brain injury," "heart just stopped beating," "no heart beat," "cadaver" and "sudden death." The chart below shows the ratio. Further analysis of these causes concludes that the "donors" were most likely alive at the time of organ removal.

Causes of "Donor" Death Described in 100 Research Papers  
100 篇论文提供供体死因的种类和比例

The first category for causes of death is “heart just stopped beating” and “no heart beat,” which makes up approximately 18% of the “donors” discussed in the medical papers. Why wasn’t “cardiac death” used? This is because cardiac death organs are not transplantable because of the prolonged warm ischemia time. Yet “no heart beat” and “heart just stopped beating” have the connotation that the transition from beating-heart “donor” to non-beating-heart “donor” was arbitrary, controlled and premeditated.

The second category for causes of death is “cadaver” and “sudden death,” which makes up approximately 30% of the “donors” discussed in the medical papers. Strictly speaking, the cause and time of death of a cadaver or sudden death is not clear. However, almost all organs extracted from these “donors” have warm ischemia time of less than 10 minutes. The short warm ischemia time indicates that the cadavers were all fresh and that in less than 10 minutes after death, the organs were already removed. The question is how the “fresh cadavers” and “sudden death cadavers” ended up on an operating table for organ removal in such short period of time. The only explanation is that the deaths were “expected” and the organ removal personnel had advanced notice that there would be “fresh cadavers” available.

The third category for causes of death is “brain death” and “traumatic brain injury,” which makes up approximately 51% of the “donors” discussed in the medical papers. Without brain death regulation, over half of the “donors” died of brain death, this by itself is implausible. Moreover, analysis in section II indicates that the so-called brain death persons were not intubated, were not on ventilators and apnea testing was not performed. The “donors” might not really be brain dead, or they were arbitrarily put into “brain dead” state.

A focused analysis of heart transplant research papers from 45 hospitals in China was done. This group of heart transplants was performed prior to March 2009. Among all the “donor” hearts, 685 cases (78%) were from so-called “brain dead” persons, 186 cases (21%) had no specified sources, and 5 cases (1%) were from “cadavers.” Moreover, the 5 cadaver hearts happened to come from the same paper by Liaoning province Dalian University Affiliated Hospital. From January to June 2005, Dalian University Affiliated Hospital obtained 5 “cadaver” hearts for transplant. “The cadavers were male, ages 24 to 46. The warm ischemia time was 2 to 6 minutes; the cold ischemia time was 112 to 235 minutes[20].” The warm ischemia

Mail address:

www.upholdjustice.org  
Tel: 001-347-448-5790  
Fax: 001-347-402-1444

time suggests that within 2 to 6 minutes after death, the hearts were already extracted from the cadavers. The cadavers were most likely living prior to heart extraction. The cold ischemia time suggests that within 2 to 4 hours, the hearts were transplanted. This indicates that the organ extraction and transplantation were mostly likely performed at the same location. The July 2010 edition of Organ Transplantation, supervised by the Ministry of Education, claims that “since 2001, under the guidance of Dr. Chen Zhonghua and his team to fight for donation after brain death, there have been over 60 organ donations after brain death in the entire country[21].” However, WOIPFG’s small scale focused analysis of papers from 45 hospitals shows at least 685 hearts harvested. This number is already far greater than the official number.

To summarize, the terminologies used by the medical papers to describe causes of death are used to hide the true source of organs, their medical meaning has been lost.

### 3.3 Chinese Media Reports Indicate almost no “Brain-Dead Donors” Prior to July 2006

On July 11, 2006, People’s Daily published an article titled “Our country’s first donation heart transplant was successful.” The article stated “On July 1, 2006, the 18<sup>th</sup> brain dead donor donated a heart. The transplant surgery was successful. This is the first successful case of heart transplant using a brain dead donor.” The article also quoted Dr. Chen Zhonghua saying, “by far there are 18 cases of successful brain death organ donation in China[22].”

On July 25, 2006, Yangcheng Evening News published an article titled “First brain dead donor lung transplant successful.” The article stated “the first lung transplant from a brain dead donor was successfully carried out in Shenzhen People’s Hospital on July 19, 2006... There are about 100 such operations in the country and only 4 in Guangdong province.” The article also quoted Chen Zhonghua saying, “the lung was from Ms. Yang, a 39 year old female brain dead donor, who wished to donate her heart, liver, kidneys, lung, and cornea. She is the first voluntary brain dead organ donor in our country[23].”

These two state-run media reports indicate:

- Prior to Ms. Yang, all brain dead “donors” were involuntary.
- The 17 other brain dead “donor” organs prior to July 1, 2006 were either not heart, or failed in transplantation. So all medical papers prior to July 1, 2006 that described successful transplantation using brain dead “donor” organs were in fact, either “living donor organs” or harvested without consent from “donor” or family member.

That is to say, the Chinese state controlled media proved the non-existence of “brain dead donors.”

### 3.4 Suspiciously Similar Descriptions of Cornea Donors

In China, no matter how big or small a hospital is, as long as it performs corneal transplant, the corneal grafts are “fresh.” Medical papers on corneal transplant use surprisingly similar phrases to describe the “donors.” The most frequently used words are “sudden death” and “young adults.” The corneas were usually harvested within 10 minutes to several hours after death. The transplants happened within 10 to 24 hours. The table below gives some examples.

**Table 1. Suspiciously Similar Descriptions of Cornea “Donors”: “Sudden Death, Young Adults”**

	Hospital Name	Time Period of Transplants	No. of Corneal Transplants	Description of “Donors”
1	北京市监狱管理局中心医院和北京同仁眼科中心 Central Hospital of Beijing Prison Administration Bureau & Beijing Tongren Hospital Eye Center	1993 - 2005	27 cases (30 eyes)	死亡青壮年男性[24] Deceased young adult male.
2	广州眼库	No description of	45 cases	供体死因均为猝死，年龄 20-43

				completed within 2 hours of death.
28	江苏省南京鼓楼医院 Nanjing Drum Tower Hospital, Jiangsu Province	January 2001 – December 2005	12 cases (13 eyes)	供体年龄 <b>20 岁左右</b> [50] “Donors” were about 20 years of age.
29	武警安徽省总队医院 Anhui Armed Police Corps Hospital	1999/5 – 2008/12	119 cases (123 eyes)	供体为 <b>猝死的青壮年</b> [51] “Donors” were young adults of died sudden death
30	广州医学院第三附属医院 Third Affiliated Hospital of Guangzhou Medical College	Until 2009	96 cases (97 eyes)	供体来源为 <b>猝死的青壮年</b> ，死后 1~2h 取材 [52] “Donors” were young adults died of sudden death, corneal grafts were removed within 1 to 2 hours after death.

What was the cause behind the “sudden death” of “young adult male”? How were the various hospitals notified of the “sudden death”? How did the hospitals manage to arrive at the scene of “sudden death” in no time to harvest “fresh” corneas? How did the hospitals find recipients and perform transplants within 10 to 24 hours?

## 4 Extremely Short Warm Ischemia Time: Sign of Living “Donors”

Most research papers describe warm ischemia time of organs harvested to show how “fresh” they were. Setting aside a few living donor transplants, the rest are “cadaveric donors”, “brain dead donors” or “no-heart-beat donors.” Normally the warm ischemia time of these organs would be considerably longer. But most papers describe the warm ischemia time to be less than 10 minutes. Some even say that the warm ischemia time was zero. And there is no difference in warm ischemia time among different types of organs and different types of “donors.”

### 4.1 Majority of Research Papers Report Warm Ischemia Time to be Less Than 10 Minutes

Mail address:  
P. O. Box 84  
New York, NY  
10116 USA

World Organization to  
Investigate the Persecution  
of Falun Gong

Tel: 001-347-448-5790  
Fax: 001-347-402-1444

To investigate the criminal conduct of all institutions, organizations, and individuals involved in the persecution of Falun Gong; to bring such investigations, no matter how long it takes, no matter how far and deep we have to search, to full closure; to exercise fundamental principles of humanity; and to restore and uphold justice in society.

The living donor cases were excluded from the above data. Most warm ischemia time was 4 to 6 minutes. Such fast organ removal can only be possible when the time and location of “donor” death are predictable. The time and location of death of executed prisoners are indeed predictable, but the number of executed prisoners is limited and their organs are not all transplantable. There must be another group of “donors,” whose time and location of death is predictable, who out-number the executed prisoners, and whose organs are of high quality.

Below are a few examples of zero or extremely short warm ischemia time.

## 4.2 First Affiliated Hospital Wenzhou Medical College: Zero Warm Ischemia Time in Heart Removal

A paper by the First Affiliated Hospital of Wenzhou Medical College in Zhejiang province, a.k.a. the First Provincial Wenzhou Hospital of Zhejiang, described 3 heart transplants performed between Feb. 2003 and Apr. 2004. The paper said, “All donors were male, ages 18, 32 and 45; warm ischemia time was zero[53].”

例肝功能正常。心脏移植供体 3 例,均为男性,供受体之间体重差不超过 20 g,与受者配型合适,既往无心血管疾病史,无肝炎、结核等传染病史。其供心情况见表 1。

表 1 供心情况

供体	年龄 岁	热缺血 min	冷缺血 min	总缺血 min	复跳
例 1	32	0	147	147	除颤
例 2	45	0	135	135	自动
例 3	18	0	170	170	自动

At the time of heart extraction, the heart was still beating. Step 2.1.1 in the graph below said, “Cold cardioplegia was delivered to the heart through the aortic root, in order to make the heart stop beating...”

## 2.1 供心保护方法

2.1.1 心脏停搏 心脏停搏除缺血(主动脉阻断)、降温因素外,主要依靠主动脉根部灌注冷晶体停搏液,晶体停搏液依靠高钾停跳,使心肌处于舒张停搏状态。

2.1.2 低温保存 切取供心过程中,经主动脉向冠状动脉灌注 4 °C 停搏液,不仅使心脏迅速停搏,同时使心脏均匀降温。同时在供心周围倒入一定量的冰泥及冰水,使心脏表面迅速降温。

The warm ischemia time of executed prisoner organs cannot be zero. The paper did not use the common excuse of “brain death” either. Is it admitting that the 3 male “donors” were alive?

## 4.3 Wuxi No.2 People’s Hospital: Zero Warm Ischemia Time in Liver Transplant

A research paper described 5 liver transplants performed by Wuxi No.2 People’s Hospital in Jiangsu Province on Dec. 25, 2000, Jan. 30, 2002, March 13, 2002, Sept. 28, 2002 and March 24, 2003. The paper said, “5 livers were from fresh cadavers whose hearts just stopped beating[54].”

1.2.1 供肝获取 5 例供体均来自心跳刚停止的新鲜尸体,采用快速供肝切取技术,即取腹部大“十”字切口进腹,迅速探查肝脏,如肝脏色、质正常,向肝脏表面及周围放入碎冰,自

“The livers were of good quality, from brain-dead healthy young men”, “The warm ischemia time of the five livers was almost zero.”

例, 年龄较轻, 平均 45.6 岁。供肝为脑死亡的健康青壮年男性, 供肝质量好。这些都是保证肝移植手术成功的关键。我们强调供肝获取易采用快速供肝切取法<sup>[1]</sup>, 尽量减轻肝脏的损害。本文 5 例供肝热缺血时间基本为零, 尽量减少冷缺血时间, 我院 5 例冷缺血时间均控制在 15 小时以内, 时间越短越好。5 例中有 1 例因使用外地供肝冷缺血时间达 13 小时,

How to extract livers from “brain-dead” healthy young men quickly so that the warm ischemia time would be zero minute?

The only explanation is that the healthy young men were alive when their livers were extracted.

#### 4.4 Nanfang Hospital: Zero Warm Ischemia Time in Heart Removal

On April 5, 2000, Guangzhou Southern Medical University (former No.1 Military Medical University) affiliated Nanfang Hospital performed a heart transplant. “The donor was a brain-dead male, had same blood type as the recipient, PRA < 1%, HLA half match, warm ischemia time was 0, cold ischemia time was 90 minutes<sup>[55]</sup>.”

#### 4.5 More Examples of Short Warm Ischemia Time

Table 2. Examples of Extremely Short Warm Ischemia Time

	Hospital Name	Time Period of Transplants	Warm ischemia Time of Extracted Organs
1	南京医科大学附属医院 The Affiliated Hospital of Nanjing Medical University	2005/3 - 2007/11	125 例肝移植中有 112 例为“尸体供体”, 但是这些供肝的热缺血时间却在 0 到 10 分钟之内, 平均为 3.96 分钟 <sup>[56]</sup> 。 Among 125 liver transplants, 112 were from deceased “donors.” The warm ischemia time was 0-10 minutes, average 3.96 minutes.
2	浙江大学医学院附属第二医院 The Second Affiliated Hospital of Zhejiang University School of Medicine	1999/8/31 – 2001/2/9	实施肝移植 10 例, 供体 10 例脑死亡者, 采取多器官联合快速切取, 热缺血时间 0~5min, 平均 3.06min <sup>[57]</sup> 。 Conducted 10 liver transplants, all 10 “donors” were brain dead. Fast simultaneous extraction of multiple organs was conducted. The warm ischemia time was 0-5 minutes, averaging 3.06 minutes.
3	江苏南通医学院附属医院 The Affiliated Hospital of Nantong Medical College, Jiangsu Province	2000/11 – 2003/5	4 例原位心移植的供体为“脑死亡者, 男 3 名, 女 1 名, 死前心功能正常。4 例供体在脑死亡后快速正中开胸。。。”此 4 例供心的热缺血时间为 0 到 2 分钟 <sup>[58]</sup> 。 4 orthotopic heart transplant “donors” were brain-dead, 3 were male, 1 was female, heart function normal before death.

of Falun Gong  
追查迫害法轮功国际组织

www.upholdjustice.org  
Tel: 001-347-448-5790  
Fax: 001-347-402-1444

			All 4 “donors” chest were cut open quickly after brain death...” The warm ischemia time was 0 to 2 minutes.
4	南京市鼓楼医院 Nanjing Drum Tower Hospital, Jiangsu Province	2004/6 – 2005/6	获得 42 例供肝，热缺血 0-5min，供体为“脑死亡，19-38 岁，无传染性、感染性疾病及肝肾疾病”[59]。 Obtained 42 donor livers, with warm ischemia time of 0 to 5 minutes. “Donors” were brain dead, 19 to 38 years of age, free of infectious diseases, kidney and liver diseases.
5	解放军第二炮兵总医院 The Second Artillery General Hospital of Chinese People’s Liberation Army, Beijing	2004/7 – 2007	实施的 103 例肝移植，“供体都是健康的年轻人，其中脑死亡供肝 1 例，其余为同血型尸体供肝。”然而这 103 例供肝的热缺血时间却为 0 到 5 分钟[60]。如果这些供体在被切取肝脏的时候已经是尸体的话，热缺血时间是如何控制在 5 分钟以内的？ 103 liver transplants, “all donors were healthy young people, 1 brain-dead donor liver, 102 deceased donor liver. Donors and recipients have the same blood type. All 103 cases have warm ischemia time of 0 to 5 minutes. (If these “donors” were already dead at the time liver extraction, how could warm ischemia time be possibly controlled within 5 minutes?)
6	上海第二军医大学长征医院 Shanghai Changzheng Hospital	2001/10 – 2004/9	实施的 240 例肝移植，所使用的供肝热缺血时间为 0-8min[61]。 All 240 liver transplants had warm ischemia time of 0 to 8 minutes.
7	东莞市人民医院 Dongguan People’s Hospital, Guangdong Province	2003/4 – 2003/12	先后为 4 例患者施行原位心脏移植，供心热缺血时间（0~3.5min）[62]。 4 orthotopic heart transplants with warm ischemia time of 0 to 3.5 minutes.
8	福建医科大学附属协和医院 Fujian Medical University Affiliated Xiehe Hospital	1995/8 – 2009/3	96 例同种异体心脏移植，供体均为男性脑死亡者，20-45 岁，热缺血时间 0-15min，冷缺血时间 50-235min[63]。 96 orthotopic heart transplants, “donors” were brain-dead male, ages 20 to 45, warm ischemia time was 0 to 15 minutes, cold ischemia time was 50 to 235 minutes.
9	天津第一中心医院 Tianjin No.1 Central Hospital	2003/9 – 2005/11	200 例供肝切取情况，供体为：本组 200 例脑死亡的供体中男性 191 例，女性 9 例，均为无心跳尸体供肝[64]。在 200 例供肝中有 190 例的热缺血时间小于 8 分钟，进一步证明摘取肝脏的过程就是“供体”从活体到“无心跳尸体”的过程，而且整个过程是有预谋的。 200 brain-dead “donors” liver removal, 191 males and 9 females; all were extracted from non-heart-beating cadavers. 190 cases had warm ischemia time less than 8 minutes. (Suspiciously short warm ischemia time of non-heart-beating cadaver livers suggests the process of liver removal could be the process of turning living donors to non-heart-beating donors. Such process could be premeditated.)

## 5 “Donors” were Mostly Young Healthy Male

Among the over 300 research papers, 103 papers have information about the “donors,” such as sex, age, cause of death, blood type, and various test results, etc. An analysis of the “donor” information results in some common characters about the “donors.”

### 5.1 Absolute Majority of “Donors” were Male

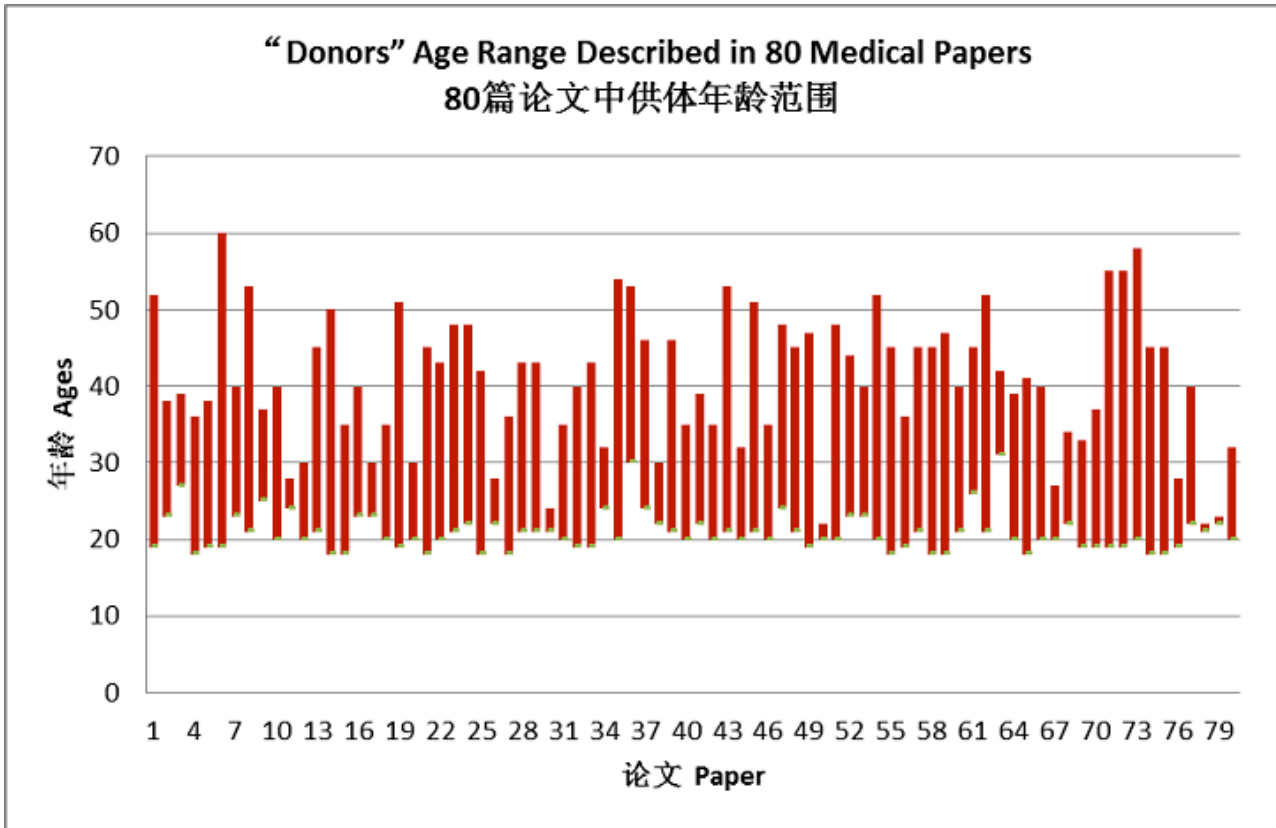

The total number of “donors” mentioned in the 103 research papers is 8710. Among which 3444 “donors” have no sex information. In the rest 5266 “donors,” 97% were male, as shown in the figure below.

### 5266 "Donors" Sex Distribution from 103 Papers 103篇论文5266个供体性别比例

### 5.2 Absolute Majority of “Donors” were under 40 Years of Age

There are 80 papers that include the age range of the “donors,” as shown in the figure below. The Y-axis is the age. The figure shows that most “donors” were 20 to 40 years old.

### 5.3 “Donors” in perfect health, unlike regular prison population

Among all the transplant performed from Aug. 2005 to Jan. 2006 by Shandong province Zaozhuang Central District People’s Hospital and Hebei United University Affiliated Hospital, 3 combined kidney-pancreas transplants were described in a medical paper. The only sentence that described the “donors” was: “donors had no history of alcohol use, no history of medication, no diabetes, no pancreatitis, and no pancreatolithiasis[65].”

**供、受体的选择：供、受体应尽可能有好的条件，  
如年龄、身体状况、无严重并存病等。供体无长期饮  
酒、用药史，无糖尿病、胰腺炎、胰管结石等病史。供**

The paper did not specify the sex, age, blood type and other test results of the “donors.” It is very unlikely the “donors” here were executed prisoners. How many executed prisoners could a mid-sized city like Zaozhuang have every year? How many of them “have no history of alcohol use and no medication”? How many have perfect tissue match with the recipients? And how could Zaozhuang Central District People’s Hospital and Hebei United University Affiliated Hospital manage to find 3 perfect “donors” in 6 months?

In the 103 liver transplants performed by the Second Artillery General Hospital of Chinese People’s Liberation Army in Beijing between July 2004 and 2007, the “donors” were “all healthy young persons. One liver was from a brain-dead donor and standard extraction was performed, the rest were from cadavers and used fast extraction. The cadavers and the recipients have the same blood types. The warm ischemia time was 0-5 minutes[66].” In fewer than 3 years, where did the

103 healthy young persons with identical blood type as the recipients come from? How could all 102 cadaveric livers have warm ischemia time of less than 5 minutes?

The table below gives more examples of “donors” with perfect health.

**Table 3. Examples of “Donors” with Perfect Health**

	Hospital Name	Time Period of Transplants	Description of “Donors”
1	东莞市太平人民医院 Dongguan (city) Taiping People’s Hospital	2002/8 – 2005/8	实施 350 例肾移植。其中肝脏联合切取组 90 例，单独切取肾脏 260 例，供体年龄 20~30 岁，肝功化验检查正常，HBsAg、HBeAg、HBeAb、HCV-Ab、HEV-Ab、HIV-Ab、RPR、TPPA 等指标均为阴性[67]。 90 combined liver-kidney extractions and 260 liver extractions. “Donors” were 20 to 30 years of age, liver function tests normal, HBsAg, HBeAg, HBeAb, HCV-Ab, HEV-Ab, HIV-Ab, RPR, TPPA tested negative.
2	北京军区总医院 Beijing Military Region General Hospital	2005/4 – 2007/7	实施 30 例原位肝移植和供体切取，为尸体供肝，行肝肾联合切取，供肝者年龄 18~42 岁。无乙肝、梅毒、艾滋病、结核、恶性肿瘤及慢性病，供肝热缺血时间为 2~7min，平均为 4.6min[68]。 30 liver transplants, combined liver-kidney extraction from cadavers. “Donors” were 18 to 42 years of age, Hepatitis B, Syphilis, HIV tested negative, no Tuberculosis, no malignant tumor, no chronic illnesses.
3	海军总医院 Navy General Hospital	2005/3- 2005/8	实施 3 例原位心脏移植，供体为脑死亡者，年龄 31 岁、22 岁和 28 岁，无心血管疾病或其他重大脏器疾病史[69]。 3 heart transplants, “donors” were brain-dead, ages 31, 22 and 28, no history of cardiovascular diseases and any other key organ diseases.
4	首都医科大学附属北京 安贞医院 Capital Medical University Affiliated Anzhen Hospital	1992/4 – 2006/4	实施 51 例原位心脏移植，供体 51 例，均为男性，年龄 21~43 岁，既往无心血管疾病或其他重大脏器病史，摘取供心的路途时间在 1h 内[70]。 51 heart transplants, all male, ages 21 to 43, no history of cardiovascular diseases and any other key organ diseases. Transportation took less than 1 hour. (In all 51 cases, the distance between where hearts were extracted and where transplantations were conducted was less than 1 hour.)
5	山东省千佛山医院 Qianfoshan Hospital, Shandong province	2002/1 – 2005/1	肝脏移植中心实施 43 例 44 次肝移植，无乙肝、丙肝、艾滋病、梅毒等经血传播性疾病，整块切取，热缺血时间 5~10min，平均 5.6min[71]。 44 liver transplants, “donors” had no Hepatitis B, Hepatitis C, HIV, Syphilis and other blood transmitted diseases. The warm ischemia time was 5 to 10 minutes, averaging 5.6 minutes.
		2003/3 - 2012/10	心外科实施 25 例同种异体原位心脏移植和供体切取。供体年龄 20~35 岁，无心血管疾病史[72]。 25 heart extractions and transplants, “donors” were 20 to 35 years of age, with no history of cardiovascular diseases.

6	山东省立医院 Shandong Provincial Hospital	2005/1-2008/12	6 例肝肾联合移植, 供体年龄 19~40 岁, 平均 28 岁, 无酗酒史, 无恶性肿瘤、感染、糖尿病等疾病, 肝、肾功能正常, 肝炎、HIV 等标志物阴性。热缺血时间为 2.5~4min[73]。 6 combined liver-kidney transplants, "donors" were 19 to 40 years of age, averaging 28. <b>No history of alcoholic use, no malignant tumors, no infectious diseases, no diabetes, liver and kidney function normal, HIV tested negative.</b> Warm ischemia time was 2.5 to 4 minutes.
7	潍坊市人民医院 Weifang People's Hospital	2001/3 – 2006/8	9 例原位全肝移植, 均取自健康青年新鲜尸体, 供体均肝功能正常, 乙肝五项阴性。采用快速整块切取法, 热缺血时间约为 5~8min[74]。 9 liver transplants, cadaveric livers from healthy young people, liver function normal, five tests of Hepatitis B negative, fast extraction method was used, warm ischemia time was 2.5 to 4 minutes.
8	山东省滨州医学院附属医院 Affiliated Hospital of Binzhou Medical College, Shandong Province	2004/10 /22	1 例右侧单肺移植手术和供体切取, 供体男性, 无心肺病史, 无吸烟史, 供肺热缺血时间为 2min[75]。 One lung transplant, "donor" was male, no history of cardiovascular and lung diseases, no history of smoking, warm ischemia time was 2 minutes.
9	济南市第四人民医院和 福建医科大学附属协和医院 Jinan No.4 People's Hospital & Fujian Medical University Affiliated Xiehe Hospital	2006/7/1, 2006/8/6	合作完成 2 例心脏移植和供体切取, 供体为 38 岁和 26 岁, 平素身体健康[76]。 2 heart extractions and transplants, "donors" were 38 and 26, and had always been in good health.
10	山东济宁医学院附属医院 Jining Medical College Affiliated Hospital, Shandong Province	2002/12/13	1 例肝移植和供体切取, 供肝者为青年男性, 脑外伤死亡, 生前体健、肝功能正常, 供肝热缺血时间为 4min[77]。 One liver extraction and transplantation, "donor" was male, died of traumatic brain injury, in good health when alive, liver function normal, warm ischemia time was 4 minutes.
11	济南市中心医院 Jinan Central Hospital	2002/8	1 例肝移植和供体切取, 供者 25 岁, 无感染、恶性肿瘤、慢性肝病[78]。 One liver extraction and transplantation, "donor" was 25 years of age, no infections diseases, no malignant tumors, <b>and no liver diseases.</b>
12	复旦大学附属中山医院 Fudan University Affiliated Zhongshan Hospital	2000/5 – 2011/4	298 例原位心脏移植, 尸体供心 291 例, 临床脑死亡 7 例, 年龄 18~45 岁, 平均 (26.8±4.5) 岁, 其中男性 283 例, 女性 15 例。均无明确心血管疾病或其他重大脏器疾病史, 这 298 例中, 自 2007 年后有 60 例供心在心室颤动或心搏停止状态下获取, 其余在心脏仍搏动时获取[79]。 298 heart transplants, 291 cadaveric hearts, 7 cases of brain-dead donor hearts, ages 18 to 45, average age 26.8±4.5, 283 male and 15 female. All "donors" had <b>no obvious history of cardiovascular diseases and other major organ diseases.</b> Since 2007, 60 hearts were extracted after the hearts stopped beating, and <b>the rest were extracted while the hearts were beating.</b>

13	南京军区福州总医院 Nanjing Military Region Fuzhou General Hospital	1999-2004	实施肝肾联合快速切取法切取供肝及肾 40 例次，并施行同种异体肝移植 40 例，本组 40 例供体均为男性无心跳尸体，平均年龄 27 岁（21~45 岁）。术前肝功能均正常、HIV 抗体阴性 [80]。 40 fast kidney-liver extractions and liver transplants, all 40 “donors” were male non-heart-beating cadavers, average age 27 (21 to 45 years of age). Liver function normal and HIV negative.
14	哈尔滨医科大学附属第二医院 No.2 Affiliated Hospital, Haerbin Medical University	2004/1	实施心脏移植 1 例，供心取自脑死亡者，37 岁，体重 72kg。死亡前身体健康，热缺血时间小于 5min [81]。 One heart transplant, “donor” was 37 years old and brain-dead, weighed 72kg, was in good health when alive, warm ischemia time was less than 5 minutes.
15	安徽无锡市人民医院 Wuxi People’s Hospital, Anhui Province	2002/9-2011/1	实施 100 例供肺获取和 101 例肺移植，供体无原发性心脏病史和肺脏病史。无心肺手术史。无严重胸外伤、无广泛性肺挫伤、无吸入性肺炎/化脓症，无恶性病变、HIV 和肝炎病毒筛选阴性 [82]。 100 lung extractions and 101 lung transplants, “donors” had no history of primary heart disease, <b>no history of lung diseases, no history of heart or lung surgery, no severe chest injury, no lung injury, no Aspiration pneumonia, no Suppurative disease, no malignant lesions, HIV and Hepatitis tested negative.</b>
16	南京医科大学第一附属医院 No.1 Affiliated Hospital, Nanjing Medical University	2004/10-2006/4	实施原位肝脏移植的 117 例和尸体供肝，供肝均无肝脏基础疾病、恶性肿瘤及明显脂肪变性，乙型肝炎血清学检查阴性。采用腹主动脉和门静脉快速双灌注法获取供肝 [83]。 117 liver transplants using cadaveric livers, “donors” had no liver diseases, no malignant tumors, <b>no obvious Steatosis, Hepatitis B Serology tested negative.</b>
17	苏州大学附属第一医院 No.1 Affiliated Hospital of Suzhou University	2000/8-2001/4	实施 5 例原位肝移植和供体切取，供体年龄 20~40 岁，无感染、恶性肿瘤及慢性肝病 [84]。 5 liver transplants and extractions, “donors” were 20 to 40 years of age, no infectious diseases, no malignant tumors, <b>no chronic liver diseases.</b>
		2000-2006 年	实施心脏移植 6 例和供体切取，供者年龄 25~37 岁，无心血管病史，淋巴细胞毒抗体试验阴性，供受者血源的巨细胞病毒、EB 病毒、肝炎病毒和艾滋病病毒均为阴性 [85]。 6 heart extractions and transplants, “donors” were 25 to 37 years of age, no history of cardiovascular disease, lymphocyte cross matching negative, <b>Cytomegalovirus, EB virus, Hepatitis virus, and HIV tested negative.</b>
18	南京鼓楼医院 Nanjing Drum Tower Hospital	2004/6-2005/6	实施 42 例尸体肝肾联合切取，共获得 42 个供肝、84 个供肾，供体男 40 例，女 2 例，年龄 19~38 岁，无传染性、感染性疾病及肝肾疾病 [86]。 42 combined kidney-liver extractions, “donors” were 19 to 38 years of age, 40 were male, 2 were female, no infectious diseases, no kidney or liver diseases.
19	镇江市第一人民医院	2005/4 -	实施 4 例全心脏原位移植和供体切取，供体均为男性，年龄

To investigate the criminal conduct of all institutions, organizations, and individuals involved in the persecution of Falun Gong; to bring such investigations, no matter how long it takes, no matter how far and deep we have to search, to full closure; to exercise fundamental principles of humanity; and to restore and uphold justice in society.

	Zhenjiang No.1 People's Hospital	2006/12	23~40岁, 既往无心、肺疾病史及胸部手术史[87]。 4 heart extractions and transplants, "donors" were male, ages 23 to 40, no history of cardiovascular and lung diseases, and no history of thoracic (chest) surgery.
20	南京市第二医院 Nanjing No.2 Hospital	2004/3-2004/11	实施快速联合切取 11 个供肝、22 个供肾移植给相应受体。11 例供体均为脑死亡, 年龄 18~36 岁, 无传染性、感染性疾病, 无肝肾及其它严重疾病[88]。 11 fast combined liver-kidney extractions, all "donors" were brain-dead, ages 18 to 36, no infectious diseases, no lung diseases, no liver diseases, no other serious illnesses.
21	无锡市第二人民医院 Wuxi No.2 People's Hospital	2000/12-2003/3	实施原位肝移植 5 例和供体切取, 采用快速供肝切取技术, 供肝为脑死亡的健康青壮年男性[89]。 5 liver extractions and transplants, "donors" were brain-dead, healthy, young adult male.
22	徐州医学院附属医院 Xuzhou Medical College Affiliated Hospital	2002/4-2002/7	实施了 2 例同种异体原位心脏移植手术, 2 例供者均为男性, 28 岁和 24 岁, 脑外伤死亡。供者生前体健, 血清乙肝、巨细胞、EB 病毒检查均为阴性[90]。 2 heart transplants, "donors" were male, ages 28 and 24, died of traumatic brain injury. "donors" had been in good health, Hepatitis B, Cytomegalovirus, EB virus (血清乙肝、巨细胞、EB 病毒检查) tested negative.
23	河北医科大学第二医院 Hebei Medical University No.2 Hospital	2001/10- 2002/10	施行肝移植 5 例。均为尸体供肝, 供者年龄 20~40 岁, 无感染、恶性肿瘤及慢性疾病, 采用单独灌注切取法[91]。 5 liver transplants, all cadaveric livers, "donors" ages 20 to 40, no infectious diseases, no malignant tumor, no chronic diseases.
24	中南大学附属湘雅二医院 Second Xiangya Hospital of Central South University	Until 2006 年	参与实施 60 例尸体肝肾联合切取, 其中 30 例为无心跳尸体供体, 男 28 例, 女 2 例, 年龄 19~37 岁, 术前检查免疫缺陷病毒和肝炎病毒系列均为阴性, 肝肾功能正常[92]。 60 combined liver-kidney extractions from cadavers, 30 cases were non-heart-beating cadaver "donors," 28 males, 2 females, preoperative testings for immune system diseases and Hepatitis were negative, kidney and liver function normal.
25	中南大学湘雅三医院 Third Xiangya Hospital of Central South University	2002/3-2005/12	实施 107 例肝移植, 和供肝切取, 均采用原位低温灌注整体器官切除法取肝, 供体 107 例, 身体健康[93]。 107 liver extractions and transplants, low temperature perfusion to the organs during extraction, all "donors" were healthy.
		2004/1-2008/6	实施 91 例原位肝移植和供体切取, 男 80 例, 女 11 例, 年龄 19~55 岁, 平均 29 岁, 术前肝肾功能及病毒学检查均正常。采用多器官联合快速切取[94]。 91 liver extractions and transplants, "donors" were 19 to 55 years of age, averaging 29. 80 males, 11 females, preoperative testing of liver and kidney functions normal, virological examination also normal. Multi-organ fast extraction method was used.
		2004/1-2006/7	实施 64 例供肝切取, 供体为无心跳尸体, 年龄 19~55 岁 (平均 32.5)。术前检查肝肾功能正常, 无脂肪肝, 丙型肝炎抗

			体、人类免疫缺陷病毒（HIV）抗体无 1 例阳性[95]。 64 liver extractions from non-heart-beating cadavers, “donors” ages 19 to 55 (average 32.5). Preoperative liver and kidney function testing normal, no fatty livers, Hepatitis C and HIV all tested negative.
26	中国医科大学附属第一医院 China Medical University Affiliated No.1 Hospital	1995/5-2005/6	实施了 122 例原位肝移植，采用腹腔器官联合快速切取技术进行了 165 例供肝和供肾联合切取，供肝切取全部为脑死亡者，年龄 20~54 岁，男 119 例，女 3 例。术前检查艾滋病病毒和肝炎病毒系列均为阴性，肝、肾功能均正常[96]。 122 orthotopic liver transplants, 165 combined liver-kidney extractions, “donors” were all brain-dead, ages 20 to 54, 119 males, 3 females, preoperative HIV and Hepatitis testing negative, liver and kidney function normal.
27	第四军医大学附属西京医院	2001/1/26- 2003/9/26	实施 26 例原位心脏移植和供体切取，供体为男性，脑死亡，无心血管病史[97]。 26 orthotopic heart transplants and extractions, “donors” were male, brain-dead, no history of cardiovascular diseases.
28	解放军第 452 医院	20067-2009/10	实施尸肾移植 164 例和供体切取，供者男性 81 例，女性 1 例，年龄 22~46 岁，平均年龄 32.3 岁。供者传染病检查无结核、肝炎、梅毒、艾滋病等传染性疾病[98]。 164 kidney transplants and extractions, “donors” were 81 males, 1 female, ages 22 to 46, average 32.3, no Tuberculosis, no Hepatitis, no Syphilis, no HIV and other infectious diseases.
29	四川省人民医院	2007/8-2009/4	完成肾移植 34 例和供体切取，供者平素身体健康，无高血压、心脏病、肺结核、糖尿病、肝肾疾病等病史[99]。 34 kidney transplants and extractions, “donors” were healthy, no high blood pressure, no cardiovascular disease, no Tuberculosis, no diabetes, no kidney and liver diseases.
30	浙江温州医科大学附属第一医院	2001/3-2004/12	对 35 例肝炎后肝硬化和急性重症肝炎患者施行肝移植，其中标准原位肝移植组 11 例,经典背驮式组 9 例,改良背驮式组 15 例, 和供肝切取，采用肝肾联合快速获取技术。所有供体来自脑死亡健康成人，供肝热缺血时间 3~7min，平均 4.4min[100]。 35 orthotopic liver transplants and extractions, all “donors” were brain-dead healthy adult, warm ischemia time was 3 to 7 minutes, average 4.4 minutes.
		2003/2-2004/1	进行了 2 例原位心脏移植，尸体供心，年龄小于 35 岁，既往无心血管疾病史，无肝炎结核等传染病史[101]。 2 orthotopic heart transplants from cadaveric “donors,” all younger than 35 years of age, no history of cardiovascular diseases, no Hepatitis, no Tuberculosis, and other infectious diseases.
31	武警山西总队医院，武警总医院 Shanxi Armed Police Corps Hospital, Armed Police Forces General Hospital	2004/10-2006	共同完成的肝移植手术 12 例和供体切取，供肝均取健康男性严重颅脑外伤死亡者[102]。 12 liver transplants and extractions, all liver “donors” were male, died of traumatic brain injury.
32	内蒙古医科大学附属医	2003/8-2004/12	完成 2 例原位心脏移植，供体均为男性，31 岁和 42 岁，脑死

	院 Inner Mongolia Medical University Affiliated Hospital		亡供心，生前体健[103]。 2 orthotopic heart transplants, “donors” were male, 31 and 42 years of age, brain-dead, in good health.
33	东莞市人民医院 Dongguan People’s Hospital	2003/4-2003/12	先后为 4 例患者施行原位心脏移植，供体均为男性，脑死亡者，年龄 20~30 岁。既往没有心血管病史，供心热缺血时间（0~3.5min）[104]。 4 orthotopic heart transplants, “donors” were male, brain-dead, ages 20 to 30, no history of cardiovascular diseases, warm ischemia time 0 to 3.5 minutes.
34	佛山市第一人民医院 Foshan No.1 People’s Hospital	1999/12- 2001/12	实施 13 例次原位肝脏移植(包括 1 例再次肝移植)和供体切取，供体年龄 20~35 岁，无感染、恶性肿瘤及慢性肝病[105]。 13 orthotopic liver transplants (including 1 secondary liver transplant) and extractions, “donors” ages 20 to 35, no infectious diseases, no malignant tumors, no chronic diseases.
35	广州军区广州总医院 Guangzhou Military Region Guangzhou General Hospital	2007	实施 50 例次供体肝肾联合灌注、切取，供者丙肝抗体、乙肝两对半、梅毒抗体、HIV 抗体等传染性指标均为阴性，无肝、肾器质性疾病[106]。 50 combined liver-kidney extractions and transplants, “donors” had no Hepatitis C, no syphilis, no HIV, no liver and kidney diseases.
36	解放军第 107 医院 107 Hospital of PLA	2003/1-2010/10	完成 168 例肝脏移植，所有为尸体供肝。供肝无恶性肿瘤，艾滋病抗体、梅毒抗体、丙肝抗体均为阴性，2 例表面抗原阳性，余均为阴性[107]。 168 liver transplants, cadaveric livers, no malignant tumors, HIV, syphilis, Hepatitis C tested negative. 2 cases of surface antigen positive, rest were negative.

The above examples are taken from papers published between 2000 and 2012. The number of “donor” organs involved in each case various from a few to over a hundred. One thing in common is that these “donors” were healthy individuals, not older than 40 years old. These healthy young people were not voluntary donors. They cannot be categorized as prisoned criminals either, because this group of “healthy young people” differentiate themselves from prison population in their health conditions.

Below are results of health screenings performed on prison populations.

From Jan. 2005 to May 2009, a health screening was done among the population in drug rehab centers and prisons in Qingyuan city, Guangdong province. The tests included HIV, Syphilis, Hepatitis B and Hepatitis C[108]. The result is shown in the table below. The 4,973 prisoners were all male, ages 19 to 70, average age 29.23, 85% were ages 20 to 39[109].

Type of people tested	Number of people tested	Percentage of HIV(+)	Percentage of Syphilis (+)	Percentage of HCV(+)	Percentage of HBsAg(+)
Drug addicts	1073	3.08%	9.97%	45.01%	22.93%
Prisoners	4973	0.30%	0.62%	9.63%	2.03%

The Hepatitis B test was done on 482 prisoners in Xinjiang province Guitun Prison between 2008 and 2012. 9.2 percent tested positive[110].

The Hepatitis B test was done on 652 males, ages 20 to 68, in prisons and labor camps in Mudanjiang city, Heilongjiang province. 16.72% were tested positive[111].

Tests (HIV, Syphilis, Hepatitis B and Hepatitis C) were done on 3 types of people, namely blood donors, peasants, and prisoners in Heze city, Shandong province in 2006. The result is shown in the table below.

组别	检测人数	抗-HIV		抗-TP		HBsAg		抗-HCV	
		阳性数	阳性率 (%)	阳性数	阳性率 (%)	阳性数	阳性率 (%)	阳性数	阳性率 (%)
无偿献血人员	2 218	1	0.05	5	0.22	7	0.32	2	0.09
农村居民	222	0	0	2	0.90	8	3.60	2	0.90
监狱服刑人员	1 543	1	0.06	19	1.23	122	7.91	21	1.36
合计	3 983	2	0.05	26	0.65	137	3.44	25	0.63

	Number	HIV		TP		HBsAg		HCV	
		Number of positive cases	Percentage of positive cases (%)	Number of positive cases	Percentage of positive cases	Number of positive cases	Percentage of positive cases	Number of positive cases	Percentage of positive cases
Blood donors	2218	1	0.05	5	0.22	7	0.32	2	0.09
Peasants	222	0	0	2	0.90	8	3.60	2	0.90
Prisoners	1543	1	0.06	19	1.23	122	7.91	21	1.63
Total	3983	2	0.05	26	0.65	137	3.44	25	0.63

The positive cases among prisoners are more than the non-prisoners[112].

A Hepatitis B test was conducted on 482 prisoners in Hangzhou city, Zhejiang province in 2009 and 29% were tested positive[113].

检测项目	结果	人数	阳性率 (%)
HBsAg	阳性	64	13.28
HBcAg	阳性	8	1.66
HBsAb	阳性	142	29.46

The “donors” in China were not the conventional prisoners. Based on their health condition, it is very likely that the majority of “donors” were captive Falun Gong practitioners.

## 6 Tissue Typing Labs Established after 2000

In China, many tissue typing labs were established after 2000.

### 6.1 Examples of Tissue Typing Labs Established after 2000

In 2002, Hebei province Organ Transplant Tissue Typing Center was established at the Hebei Provincial Blood Bank. Its main task is to perform HLA testing for kidney patients. The Center claims to have finished over 100,000 HLA testing for Chinese Bone Marrow Donor Library and served over 4,000 patients for tissue matching, domestic and abroad, by 2012[114].

Liaoning province Dalian Organ Transplant Tissue Typing Center was setup in 2001 by the Dalian city Bureau of Health. The main services are testing for kidney and liver transplants and stem cells[115].

In 2007, Jiangxi province Blood Center became a qualified HLA test lab for China Bone Marrow Bank[116].

Guangdong province Shenzhen Blood Center started HLA testing on Aug. 1, 2000. As of 2013, it claims to have performed over 50,000 HLA testing and 3,200 HLA high-resolution genotyping between non-blood-related donor and recipients[117].

Beijing Red Cross Blood Center HLA Lab started in 2001. By 2010 it has collected over 110,000 donor DNA and performed over 100,000 HLA genotyping[118].

This is another proof that after 2000 there was a boost in “donor” organs, which generated more demand in tissue typing for organ transplant. Many labs started HLA testing for profit.

### 6.2 Forensic Pathology Key Laboratory: Operated by Ministry of Health, Ministry of Public Security and the Supreme People’s Court

The Ministry of Health Forensic Pathology Key Laboratory was established in Oct. 1999 at Xi’an Jiaotong University. The Laboratory was co-founded by the Ministry of Health, Ministry of Public Security and the Supreme People’s Court. It claims that “the research in organ transplant tissue matching has reached advanced international level[119].”

Three months after the persecution of Falun Gong started, the Chinese Communist Party controlled Ministry of Health, Ministry of Public Security and Supreme People’s Court jointly established the “Forensic Pathology Key Laboratory” at Xian Jiaotong University in Shaanxi Province. The Key Laboratory was supposed to provide material evidence for criminal cases, instead, it has been involved in organ transplant and tissue matching, which should be an exclusive function of the Ministry of Health. The Ministry of Public Security and its public security system, on the other hand, have full control over the kidnapped and detained Falun Gong practitioners. The Supreme People’s Court and its court system can either “legally” issue death sentences or provide fabricated death sentence certificates for illegal organs. Thus, the Ministry of Public Security and the Supreme People’s Court became the direct beneficiaries of organ transplantation. This relationship provided motivation and practicality for the judicial system to take part in the live organ harvesting of Falun Gong practitioners.

Until December 2012, Xian Jiaotong University Affiliated No.1 Hospital has conducted 3,596 kidney transplants; in addition to directing 23 other hospitals from 13 provinces in the implementation of over 10,000 kidney transplants, as well as “propelled the development of liver, heart, lung, small intestine transplantation[120].”

Until June 2013, Xian Jiaotong University Affiliated No.1 Hospital claims to have finished 69 Donations after Cardiac Death (DCD) heart transplant, 132 DCD kidney transplants, 60 DCD liver transplants. It claimed to have implemented the most DCD transplants and has the most efficiency in utilizing the organs in the country[121]. Until December 2013, Xian

Tel: 001-347-448-5790  
Fax: 001-347-402-1444

Jiaotong University Affiliated No.1 Hospital has conducted 3,764 kidney transplant[122], among which only 132 cases (3.5%) were specified as DCD. The rest 3,632 cases of kidney transplant have no explanation of the organ source.

## 7 China's Transplantation Abnormalities Indicate the Presence of Living Donor Organ Banks

### 7.1 Henan Armed Police Corps Hospital: Transplants after Live Organ Harvesting

The medical journal Henan Medical Research Vol. 12, No 2, 2003 published a research paper titled The Experience of Homologous Orthotopic Heart Transplantation[123].

There are two descriptions regarding the "donor" heart:

"2.1 Main points in donor heart removal: systemic heparinization (2mg/kg), cold cardioplegia was delivered to the heart through the aortic root until the heart stopped beating, cut superior vena cava at 4cm above right atrium..., quickly transport the heart to the operation room."

"2.4 Main points in myocardial protection: Maintain stable hemodynamic, after cutting the aortic, deliver cardioplegia to the heart through the aortic root, in the meantime, decrease pressure in right atrium and left atrium in order to ensure perfusion after the heart stopped beating. ... The warm ischemia time was 3 minutes; the cold ischemia time was 85minutes."

From both descriptions, the following conclusion can be drawn: the heart beat was stopped by directly perfusing cardioplegic chemicals after the chest was opened. This is also confirmed by the fact that the donor heart's warm ischemia time was only three minutes. The cold ischemia time was only 85 minutes, indicating that the heart extraction and transplant took place in the same location.

The transplant was performed in 2001, when there was no definition of brain death and no specification on how to diagnose brain death in Chinese medical field. The earliest "Exposure Draft" regarding the diagnosis of brain death was published in 2003. It was not until 2010, when the "citizen voluntary donation trial projects" started to adopt the parallel standard of both cardiac death and brain death standards. Moreover, it was done with the acknowledgement that China does not have brain death legislation. In 2013, "over 90% of Chinese doctors do not understand brain death[124]."

Thus, we can conclude that the "brain dead donor" described in this medical research paper was not brain dead. The "cardiac death" was induced arbitrarily by the injection of cardioplegia. The "donor" was murdered due to a heart transplant surgery. This is not the general case when an executed prisoner's organs were harvested by multiple groups of medical personnel.

### 7.2 The Second Affiliated Hospital of Harbin Medical University: Dedicated Heart Extraction Team

In a medical research paper, a central operating room nurse at the Second Affiliated Hospital of Harbin Medical University mentioned about the hospital's "donor" heart extraction team, "The hospital has set up a highly-trained heart extraction medical team, composed of surgeons, anesthesiologists, perfusionists, operating room nurses, blood bank personnel and organ liaisons... After receiving a mandate, the team members quickly convene to conduct preoperative discussions and make work arrangements[125]." In this case, "receiving a mandate" implies that a receptor has been found, and one "donor" will die in the near future.

Mail address:  
P. O. Box 84

of Falun Gong  
追查迫害法轮功国际组织

www.upholdjustice.org  
Tel: 001-347-448-5790  
Fax: 001-347-402-1444

In the subsequent discussion about “preoperative preparations”, it was mentioned that “to shorten the donor heart’s ischemia time ... a circulating nurse will assist the anesthetist with rapid drug(s) administration”.

2.5.1 术前准备 为缩短供心的缺血时间, 洗手护士将术中使用的物品和药品准备就绪。开刀前, 2名巡回护士及时开放静脉通道, 确定静脉通畅后, 由1名巡回护士配合麻醉师迅速给药, 同时另1名巡回

This paper does not mention if the “donor” was brain-dead. On the heart extraction site, since the anesthetist “administers drug(s) rapidly”, it indicates that the “donor” was likely a conscious living person.

### 7.3 Xijing Hospital Shaanxi Province: Living “Donor” in Heart-Lung Transplant

The “donor” in one case of combined heart-lung transplant at Xijing Hospital of Fourth Military Medical University in Xi’an, Shaanxi Province, on May 26, 2008, was likely a living person. A research paper about the operation includes many paragraphs regarding the removal of the “donor” heart and lung[126].

First, this male “donor” was declared “a brain-dead patient”, and then he was intubated. In the intubation active process, the medical staff “quickly cleaned up the secretions from the donor’s nose and mouth, to prevent reflux and being inhaled into the trachea”. Notice that “inhaled into” is used here, indicating that it was the “donor’s” behavior.

织;操作过程中尽可能避免污染,摘取供体心肺前,快速清理供体口鼻处的分泌物,防止返流误吸入气管,用气管吻合器钳夹气管后,切断气管,在断端处用碘伏反复消毒清理,防止

The next paragraph mentions that the discharge of residual blood from the heart was accomplished by active heartbeat. Since the residual blood “was emptied within several cardiac cycles”, it indicates that the “donor’s” autonomous heartbeats still existed at that time.

In the end, the paper mentions that the same harvesting method had been used on 38 other “donors.” This means, around 2008, at least 38 living persons’ hearts and lungs were harvested at Xijing Hospital of Fourth Military Medical University in Xi’an. Since China has no brain-death legislation, as long as the heart is still beating, the “donor” should be considered alive. As previously mentioned, without intubation and connected to a ventilator, a person cannot be diagnosed brain-dead.

### 7.4 PLA No.281 Hospital: Matching Kidney in One Day

People’s Liberation Army (PLA) No. 281 Hospital is located in the seaside health resort of Beidaihe District in Qinhuangdao City, Hebei Province. In a medical paper, the hospital was claimed to be a “medium-sized hospital, with small-scale operating rooms and a small number of scarcely equipped staffs...Our hospital’s anesthesiology department has 3 operating rooms and 6 to 8 nurses.” Three different research papers published in 2005, 2008 and 2013 described how the hospital managed to perform hundreds of kidney transplants; in particular, how to simultaneously accomplish 6 to 9 transplant operations, despite of its lack of medical personnel and equipment.

Mail address:  
P. O. Box 84

World Organization to  
Investigate the Persecution  
of Falun Gong  
追查迫害法轮功国际组织

www.upholdjustice.org  
Tel: 001-347-448-5790  
Fax: 001-347-402-1444

The 2005 paper states that from 1991 to 2004, the hospital completed 245 kidney transplants. There were 18 instances, when 6 to 9 transplant operations were performed simultaneously[127].

The 2008 paper states that from 1991 to 2007, the hospital completed 313 kidney transplants. There were 28 instances, where 6 to 9 transplant operations were performed simultaneously[128].

The 2013 paper states that from 1991 to 2012, the hospital completed 510 kidney transplants[129].

The statistics provided in these research papers only made up part of the total number of transplant operations performed in this hospital. It shows that the total number of kidney transplants has been continuously increasing. It is evident that the hospital has always been in easy access to an ample supply of kidneys, to be able to perform an increasing number of kidney transplants year after year.

Based on the information given by the 3 medical research papers, the annual average number of kidney transplant can be derived, and shown in the table below.

During the 13 years from 1991 to 2004, a total of 245 kidney transplants were performed, at an average of 19 cases per year;

During the 3 years from 2005 to 2007, a total of 68 (313 minus 245) kidney transplants were performed, at an average of 23 cases per year;

During the 5 years from 2008 to 2012, a total of 197 (510 minus 313) kidney transplants were performed, at an average of 39.4 cases per year.

Time Frame	Total Number of Kidney Transplant	Annual Average
1991 to 2004	245	19
2005 to 2007	68	23
2008 to 2012	197	39.4

Especially noteworthy is that after 2006, when the Chinese regime's live organ harvesting was exposed, the number of transplant operations in this hospital continued to increase. Hebei Province, where PLA No. 281 Hospital is located, was not a pilot province for the human organ donation program started in 2010. It was only after 2013, that the organ donation program was promoted across China. The insignificant number of donated organs is not the cause of the increase in number of transplant at No. 281 Hospital.

In addition to an ample supply of kidneys, PLA No.281 Hospital has been able to acquire and match "donor" kidneys at an astonishing speed. On January 28, 2002, the urology department at the PLA No. 281 Hospital (currently Beidaihe Sanatorium of Beijing Military Region) performed 7 cadaveric kidney transplants[130]. In one case, the receptor was admitted into the hospital on November 13, 2001. On January 28, 2002, he underwent the first kidney transplant. And on February 5, 2002, a secondary kidney transplant was done. The process to obtain the second "donor" kidney, as described in the paper, shows that the wait time for the second kidney was one day.

The research paper describes the decision process for the second kidney transplant:

Mail address:

Tel: 001-347-448-5790  
Fax: 001-347-402-1444

次给予激素冲击及应用利尿剂治疗,无效果,至第7天晨起24小时尿量为450 ml。彩超示:移植肾无血流,考虑是移植肾动脉栓塞,经积极术前准备并联系肾源,配型合适,于2002年2月5日手术探查证实。予移植肾切除,原位再次移植。术后恢复顺利,至尿量约2000 ml/d,肌酐、尿素氮降至正常出院。

The first transplant date was January 28, 2002. The paper mentions that “on the early morning of the 7th day, the patient’s urine volume during the 24-hour period was...” The “7th day” refers to the 7th day after the first transplant operation, and it was February 4, 2002. On that day, “considering the transplanted kidney’s clogged arteries”, the doctors decided to perform another transplant. So, “with proactive preoperative preparations and contacting the kidney liaison, a suitable match was found. On February 5, 2002, the transplanted kidney was removed, and secondary kidney transplant was performed.” In this case, the process of “contacting the kidney liaison” and “finding a suitable match” only took one day on February 4. In other countries, this process would probably take two or three years. However, at the PLA No. 281 Hospital, it took only one day. This indicates the existence of a large living “donor” bank most likely controlled by the Chinese military. The PLA No. 281 Hospital is part of the Beidaihe Sanatorium of Beijing Military Region, which include PLA No.178 Hospital and the Navy Beidaihe Sanatorium[\[131\]](#).

## 7.5 Xi'an Gaoxin Hospital: “cramping in an old and beaten-down van to extract organs”

Xi'an Gaoxin Hospital was founded in 2002. At its inception, the hospital’s urology department only had “a few patients and empty wards.” At that time, the organ transplant business in China was experiencing an unusual growth. Gaoxin Hospital made the decision to “develop organ transplantation as the main direction.” The hospital started to conduct kidney and liver transplants. “The hospital’s leaders and department heads traveled far and frequently in search for kidneys and patients.” They were able to attract “foreign patients from South Korea, Japan, Israel and other countries.” Five years after the hospital was established, “the annual income (from organ transplantation) exceeded ten million yuan.” It is evident that the huge profit is one of the driving force behind the organ transplant frenzy in mainland China.

On the hospital’s website, an article describes how Gaoxin Hospital harvested organs back then: “Whether it was hot summer or cold winter, 4 or 5 staff members would crouch in an old and beaten-down van to harvest organs,” and “sometimes, 7 to 8 transplant surgeries were performed in 24 hours[\[132\]](#).” From 2003 to 2007, Gaoxin Hospital performed a total of 232 kidney transplants.

## 7.6 Emergency Transplant and Transplant with Preselected Date Rampant across China

From 2003 to 2006, Shanghai Changzheng Hospital performed 120 emergency liver transplant operations. All the recipients were severe hepatitis patients. After being admitted into hospital, their average survival time was three days. “Only emergency liver transplantation can be applied. The shortest wait time was 4 hours after a patient was admitted to hospital[\[133\]](#).”

The hepatopancreatobiliary surgery department at the First Affiliated Hospital of Zhejiang University School of Medicine is a key laboratory under the Ministry of Health for multiple organ transplantation research. A research paper by Zheng Shusen mentioned that from January 2000 to December 2004, the hospital performed 46 emergency liver transplant

**Mail address:**

**Fax: 001-347-402-1444**

operations. All of the patients underwent orthotopic liver transplant operations within 72 hours (of being admitted to hospital)[134].

The most famous organ transplant center in Henan Province, Zhengzhou People's Hospital Liver Transplant Surgery Department, "performed nearly a hundred liver transplant operations every year, and successfully carried out more than 10 combined liver-kidney transplants and combined pancreas-kidney transplants. The department carried out the first case of intestinal transplant in Henan Province, and actively researched on abdominal cluster transplantation. The department successfully performed 20 emergency liver transplants for acute hepatic failure patients. It has completed more than 30 liver transplants without blood transfusion, among which, six were for elderly patients over the age of 70[135]."

Among the liver transplant operations performed by the Affiliated Hospital of Zunyi Medical College in Guizhou Province between 2003 and 2006, "there were 2 emergency liver transplants and 6 liver transplants with preselected dates." In all 8 operations, whether emergency or with preselected dates, the organs' warm ischemia time was between 2 and 5 minutes. It is evident that the donor's "death" was planned in advance.

From 2001 to 2004, PLA No.150 Hospital in Henan Province performed 2 emergency liver transplants and 8 liver transplants with preselected dates[136].

From January 2003 to January 2009, PLA No.107 Hospital completed 22 emergency liver transplants[137].

Between 2003 and 2004, the First Affiliated Hospital of Xiamen University performed an emergency liver transplant[138].

Wang Xuan, the director of the Liver Transplant Center at Nanjing PLA No.81 Hospital founded the transplant center in July 2003. It is said that Wang Xuan "has unique accomplishments in the area of precise hepatectomy." From the center's inception to the end of 2010, Wang Xuan had performed more than 250 allogeneic liver transplants, 1 combined liver-kidney transplant and 15 emergency liver transplants[139].

From September 2004 to October 2005, the Organ Transplantation Center at Renji Hospital Shanghai Jiaotong University School of Medicine completed 8 emergency liver transplants[140].

On February 12, 2003, PLA Tibet Military Region General Hospital admitted one renal failure patient. "After finding matching kidneys, on the morning of March 28, the hospital's dean Li Suzhi and Professor Zhang Yinpu jointly carried out the kidney transplant surgery[141]." From the patient's arrival at the hospital to the completion of the kidney transplant operation, it took a total of 44 days. This has been reported by the media as "the first kidney transplant on the snowy plateau (of Tibet)".

From 2001 to 2010, among the 561 liver transplants performed by the Shanghai Jiaotong University Affiliated No.1 People's Hospital, there were 29 liver re-transplants. Among them, there were two cases, where the time interval between the first and second operations was shorter than 30 days[142].

On October 26, 2007, Jiangxi Provincial People's Hospital admitted a diabetic and renal failure patient. After 7 days, on November 2, the patient underwent a combined pancreas-kidney transplant operation[143].

In a single-lung transplantation case performed by the First Affiliated Hospital of Xinjiang Medical University, the recipient was admitted into hospital on March 28, 2004. After 14 days, on April 11, 2004, the recipient underwent a lung transplant surgery. The donor's "heart and lungs were removed as a whole", and the removed lungs "were sent to the hospital by an aircraft (which took 3 hours)[144]."

供者 38 岁, 男性, 体重 60 kg, 身高 160 cm。供、受者的 ABO 血型均为 A 型, EB、HIV、CMV 病毒及乙型肝炎病毒均为阴性, 淋巴细胞毒试验阴性, 受者 PRA 阴性, HLA 仅有 1 个位点相容, 相容性较差。

2. 手术方法: (1) 供肺获取: 供者仰卧位, 正中劈开胸骨进胸。游离上、下腔静脉并上阻断带。游离升主动脉和肺动脉圆锥, 自肺动脉圆锥处插入肺灌注管。经肺动脉圆锥根部注入 1000  $\mu$ g 前列地尔, 剪下下腔静脉、左心耳, 行双侧肺灌注。灌至双肺完全发白(共用 4  $^{\circ}$ C LPD 液 3000 ml)。用体积分数为 50% 的氧通气, 使双肺中等膨胀后直线切割缝合器缝闭气管, 剪断主动脉、气管及上腔静脉, 整体取下心肺标本。将双肺在 4  $^{\circ}$ C LPD 液 3 L 中浸放保存, 放至手提冰柜中, 用飞机送至医院(历时 3 h)。在供肺获取确定一切无误后, 手术组开始手术。(2) 移植手术: 受者右侧卧位, 左胸前外侧第

The research paper does not give a description of the donor's cause of death. However, the physical exam and tests are comprehensively exhibited in the paper. The donor-recipient matching was completed within 14 days. It is evident that the donor had been selected, and the organ harvesting, transportation and transplantation were prearranged.

In addition, from 2003 to 2004, the First Affiliated Hospital of Xinjiang Medical University performed 3 liver transplants to treat fulminant hepatic failure (FHF)[145]. Fulminant hepatic failure would cause a series of serious syndromes within two weeks (of the onset of the illness). It has a rapid onset and can lead to quick deaths. As "the three patients were all in critical condition", "rescue transplants" had to be performed within two weeks after the onset of fulminant hepatic failure. Where did the First Affiliated Hospital of Xinjiang Medical University so quickly obtain the donor livers from?

## 7.7 Multiple Transplants Performed Consecutively or Simultaneously

On Dec. 29, 2005, Foshan No.1 People's Hospital in Shandong Province simultaneously performed 7 kidney transplants[146].

From Dec. 28, 2004 to Dec. 29, 2004, in less than 24 hours, 5 kidney transplants and 2 liver transplants were performed in Foshan No.1 People's Hospital[147].

From noon on April 25, 2002 to 2pm the next day, Shengli Oilfield Shengli Hospital, in Shandong Province, performed 6 kidney transplants in succession. A media report said, "This (series of) kidney transplants is the first, as well as the largest in scale, in the history of Shengli Oilfield and the history of Dongying City, Shandong Province". The report said that on the day before the operations, "deputy director Kang Xinli, organized the urology and anesthesiology department staff to travel to another location to collect "donor" kidneys. They arrived at the hospital at 12 noon on April 25, despite the fatigue

Tel: 001-347-448-5790  
Fax: 001-347-402-1444

resulted from long-distance travel, upon returning to the hospital, the staff started to perform the surgeries[148].” It is evident that the donors’ emergence and the recipients’ selection were both pre-planned, and the organ harvesting was premeditated.

In addition, on Oct. 27, 2002, within 24 hours, Shengli Oilfield Shengli Hospital carried out 5 kidney transplants and one liver transplant. From Jan. 9 to Jan. 12, 2004, the hospital carried out 10 kidney transplants and one liver transplant. The hospital performed its first kidney transplant in Oct. 1999 and its first liver transplant in Oct. 2002[149].

During the May 1 public holidays in 2001, Jiang Hua, from the ophthalmology department of Jinan Military Region General Hospital, led his entire department to continuously perform corneal transplants. During the day, they went to other places to collect corneas, and in the evenings, they performed surgeries. They worked around the clock every day for the entire week[150]. This article published in 2009 says in the end, “Over the years, many holidays were spent in this way”. In “a lot of holidays”, they went to other places to collect corneas, and then they would immediately perform the transplants. This indicates that the corneas were freshly-cut, and they were not taken from any eye bank. Not to mention, “eye banks in China are basically in a state of zero inventory[151]”. Then, why during the “many holidays”, the donors would emerge? The hospital staff had to make a special trip to others places to collect corneas. This suggests that the whole process was premeditated. And there could not be only one pair of cornea harvested. It is highly likely that a certain CCP department is in charge of coordinating the distribution of live “donors,” and it often arranges the hospitals, with which it has connections, to go and harvest organs during the holidays.

On Dec. 27, 2007, Qu Qingshan, director of the kidney transplant center at Zhengzhou People's Hospital, completed 13 kidney transplants within 21 hours[152]. In an article published in February 2009, the hospital claimed that it completed “322 kidney transplants within 2 years, ranking the first in the entire country[153].”

In August 2000, Dongfeng General Hospital in Shiyan City, Hubei Province, simultaneously carried out “a series of large-scale organ transplant activities” composed of 10 kidney transplants, one parathyroid transplant and 3 corneal transplants, all on the same day[154].

The number of kidney transplant surgeries performed by Yue Zhongjin from Lanzhou University No. 2 Hospital ranks the first in Gansu Province. He has set the record for the highest number (of consecutively performed transplant surgeries) in Gansu Province by leading his entire department to continuously perform 8 kidney transplants within 32 hours[155].

## 8. Organ Harvesting Happens Throughout China

The over 300 research papers were published after 2000. There were very few such papers prior to 2000. The papers discuss many different types of organ extraction, such as single organ extraction (liver, kidney, heart, lung, cornea, etc.) and multi-organ extraction (intra-peritoneal cluster, liver-kidney, pancreas-kidney, heart-lung).

### 8.1 Organ Harvesting not Limited by Region, Happens in All Provinces

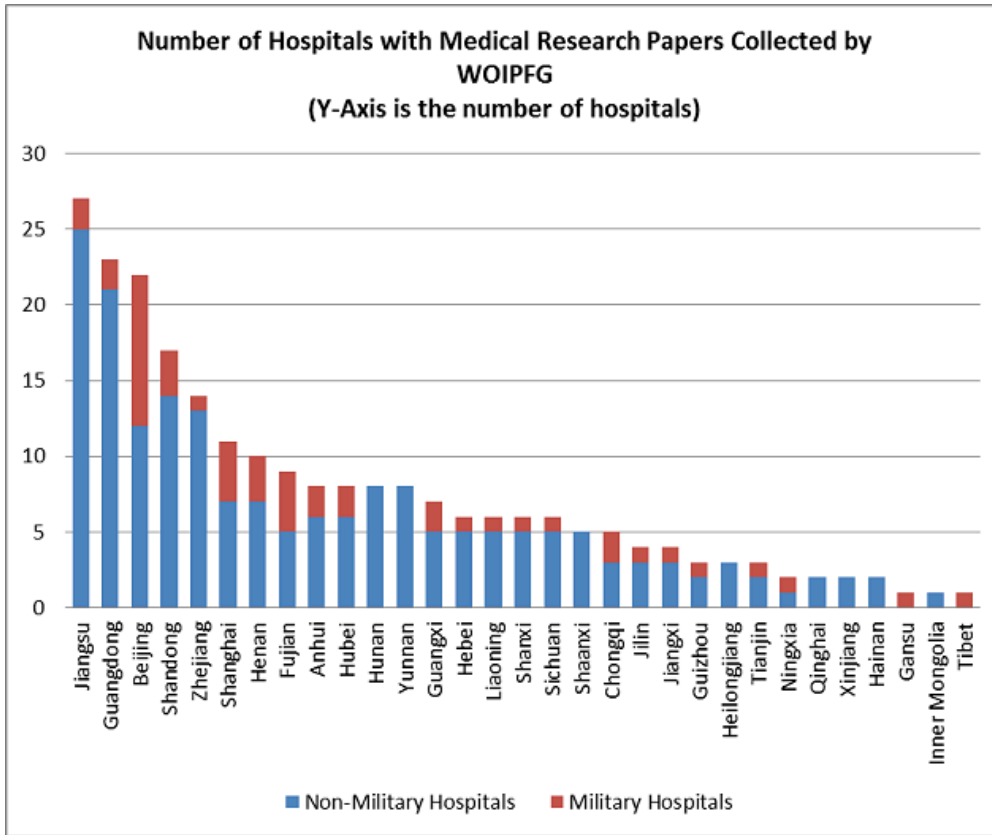

Categorize the papers based on the location of the hospital where the authors work, all 31 provinces and municipalities were involved. The chart below shows the number of hospitals in each province.

## 8.2 Focusing on Tianjin No. 1 Central Hospital: Annual Average 600 liver transplants

As of 2004, Tianjin No.1 Central Hospital Orient Transplant Center performed 2,248 liver transplants, averaging 600 liver transplants and 300 kidney transplants every year. It was said that the liver transplant annual average was the highest in the world. In addition, the Transplant Center also helped 47 hospitals from 16 provinces to conduct over 300 liver transplants in total[156].

With the help from Tianjin No.1 Central Hospital, Beijing Armed Police Forces General Hospital performed over 220 liver transplants in 2005[157].

In 2004 alone, Tianjin No.1 Central Hospital conducted 507 liver transplants at its own premises and 300 liver transplants elsewhere. It amounts to 1/3 of the total liver transplants done in the country and broke the world record held by University of Pittsburgh Organ Transplant Center. In January 2005, 108 liver transplants and 43 kidney transplants were conducted. That is 4 to 5 liver transplant operations per day in a 5 day working week[158].

According to China Liver Transplant Registry, Tianjin No.1 Central Hospital and Beijing Armed Police Forces General Hospital jointly finished 6,270 liver transplants by 2010, which amounts to 30.2% of the national total. In addition, Tianjin No.1 Central Hospital also helped 66 hospitals from 22 regions, which amounts to 2/3 of the national total[159].

The paper below is an example of liver extraction done by Tianjin No.1 Central Hospital.

The paper published on April 2008 edition of Tianjin Nursing said, “from 2002 to 2006, 2,195 liver transplants were done, 2,500 livers were extracted from cadavers of brain-dead donors, all of whom tested negative in HIV, Syphilis, Hepatitis B and Hepatitis C[160].” This implies that the number of donors is greater than the number of liver extractions, which is bigger than the transplant number. Moreover, whether the organ is transplantable was determined after the “donor” was cut open and organ was exposed. The section titled “initial exam on donor liver” in the paper said the fatty livers can be determined by observing the color of the livers, “mid-level and above fatty livers will be discarded.” Note that at that time, the “donor” was opened up and the liver was not yet extracted.

**3.2.1 供肝质量初检** 供体切取采用腹部大十字切口,协助医生拉开右侧肋弓,观察供肝表面颜色,肝表面有无脂肪颗粒,肝下缘是否锐利。如肝下缘变钝,表面发黄并可见脂肪颗粒即判断为脂肪肝。按脂肪肝轻、中、重分级来决定供肝的留取。一般中度以上脂肪肝采取放弃的态度,因中度以上脂肪肝术后易发生移植肝原发无功或肝功能延时恢复。

After the livers were extracted, “mid-operation testing” was done to determine if the liver would be transplanted.

**3.3 术中化验检测** 术中化验检测结果直接决定是否保留供肝。我中心现对每个供体都进行现场快速检测,包括血型、肝功、梅毒、HIV 等。在现场操作时可以采取等倍稀释血液后滴入视窗或先在视窗滴入原血 1 滴后再滴入缓冲剂或等渗盐水。等候 20 min 观察窗口即可出现结果。为保证化验的准确,可采取验 3 套试纸。

Even though the title of the paper mentioned “cadaveric livers,” all of the 2,500 livers had warm ischemia time of less than 10 minutes and the extraction time was under 30 minutes, the cold ischemia time was under 12 hours. Note that the paper said at the beginning that “extraction was done after brain death occurred.” It is likely that the “donor” was alive and well before liver extraction and the death was the result of organ extraction.

Tianjin No.1 Central Hospital also claims that from January 1999 to July 2005, 80 secondary liver transplants were done. Among these 80 cases, the period between first and secondary liver transplants for 14 cases were 1 to 7 days, 10 cases had wait time of 8 to 30 days, and 56 cases had a wait time of over 30 days[161]. That is to say, at least 24 cases had wait time less than 30 days.

### 8.3 Many Hospitals Conducted Large Numbers of Organ Extractions

The Chinese regime officially admitted that around 2006, there were about 650 hospitals doing human organ transplants. The table shows some hospitals that conducted large numbers of transplants.

**Table 4. Hospitals with Large Numbers of Transplants**

	Hospital Name	Time Period of Transplants	Description of Organ Extraction and Transplant
1	武汉大学中南医院 Zhongnan Hospital of Wuhan University	2002-2012	407 例供肝, “取自急性脑死亡和急性心死亡供者。热缺血时间平均 (18+/-10) min[162]” 407 “donor” livers from “acute donor of brain death” and “acute donor of cardiac death.” Warm ischemia time average was 18+/-10 minutes.
2	第二炮兵总医院 The Second Artillery General Hospital of Chinese People’s Liberation Army, Beijing	2004-2007	肝移植和供体切取 103 例[163] 103 liver extraction and transplant
3	解放军第 309 医院 (总参总医院) No.309 Hospital, People’s Liberation Army	1988/12-2003/4	单纯肾脏摘取 431 例, 肝肾联合摘取 55 例, 胰-肾联合摘取 10 例, 心肝肾联合摘取 10 例[164] 431 kidney extraction, 55 liver-kidney combined extraction, 10 kidney-pancreas extraction, 10 heart-liver-kidney extraction.
4	辽宁省人民医院和中	Until 2007	肝肾联合快速切取及分离近百例[165]

### 8.4 Suspicious connection: Dongguan Taiping People's Hospital, Kunming Kidney Hospital and Kunming Forensic Hospital

From January to October 2002, Dongguan Taiping People's Hospital performed 59 combined liver-kidney transplants and 152 kidney transplants[200].

From August 2002 to August 2005, the same hospital performed 90 combined liver-kidney transplants and 260 liver transplants[201]. A mid-sized hospital in the mid-sized city of Dongguan, Guangdong Province was able to conduct at least 211 organ extractions in 10 months' time in 2002 and more than 350 organ extractions from 2002 to 2005. Where did all those organs come from? The director of the Urology department, Li Jie participated in over 4,000 kidney transplants and over 50 liver transplants, was the main surgeon in over 500 kidney transplants and 12 liver transplants[202]. As of April 2008, Dongguan Taiping People's Hospital Organ Transplant Center and Kunming Forensic Hospital in Yunnan province jointly conducted 1,537 kidney transplants[203].

Note that Kunming Forensic Hospital also has a Hemodialysis kidney transplant center[204], which used to perform paternity tests but started HLA testing since 2001. The Forensic evidence room of Kunming forensic hospital claims to have "conducted several thousand HLA testing from 2001 to 2008[205]."

Kunming Kidney Disease Hospital Yunnan Organ Transplant Center Branch, has attracted kidney transplant patients from "Hong Kong, Taiwan, Macao, Australia, Thailand, Indonesia, Malaysia, Singapore, Vietnam and others totaling over 10 countries and regions." Kunming Kidney Disease Hospital's online advertisement had a section titled "advantages of our kidney transplants." Below is the website screen shot captured in July 2007[206].

**3.3 术中化验检测 术中化验检测结果直接决定是否保留供肝。**我中心现对每个供体都进行现场快速检测,包括血型、肝功能、梅毒、HIV等。在现场操作时可以采取等倍稀释血液后滴入视窗或先在视窗滴入原血1滴后再滴入缓冲剂或等渗盐水。等候20 min 观察窗口即可出现结果。为保证化验的准确,可采取验3套试纸。

#### Advantages of our Kidney Transplants

We are one of the earliest hospitals in China to start HLA matching and PRA, in order to select suitable donor organs for our patients.

1. we **guarantee to find healthy kidneys suitable for every patient in the shortest time possible;**
2. the donors were all tested of infectious diseases, such as HIV, Syphilis, Hepatitis B and Hepatitis C by national health organization;
3. We **provide donor organs with the shortest warm ischemia time and cold ischemia time;**
4. Our center preforms transplant operations every week and is **the only transplant center in the country that matches donors to recipients;**

To investigate the criminal conduct of all institutions, organizations, and individuals involved in the persecution of Falun Gong; to bring such investigations, no matter how long it takes, no matter how far and deep we have to search, to full closure; to exercise fundamental principles of humanity; and to restore and uphold justice in society.

Mail address:

追查迫害法轮功国际组织

www.upholdjustice.org  
Tel: 001-347-448-5790  
Fax: 001-347-402-1444

The above is to guarantee successful short term and long term transplant results. With good HLA matching the kidney transplant is more likely to be successful.

#### Protecting Patients' Rights

If a patient is not in a transplantable condition, no operations will be forced upon the patient; prior to an operation the patient must go through PRA and HLA testing; if the donor organ is not in perfect condition, no operation will be done; as long as a doctor agrees to preform kidney transplant, he or she is confident that the operation will be successful; **if not successful we will repeat the transplant operation until it is successful**, and we do not charge for all the extra transplant operations; there is no age limit; all donor organs are equipped with full documentation of health condition, including liver and kidney function tests and HIV tests results; our patients use the state-of-the-art medications prior to the operation and the medical equipment used during the operation is the best in the country.

Address: Guanshang Guanyu Street, Kunming, China

Telephone: 0871-7269277

As stated in its advertisement, Kunming Kidney Disease Hospital “**guarantee to find healthy kidneys suitable for every patient in the shortest time possible**”, “provide donor organs with the shortest warm ischemia time and cold ischemia time”, “**the only transplant center in the country that matches donors to recipients**”, “**if not successful we will repeat the transplant operation until it is successful**”... Such confidence is possible only when there is a large donor bank available on demand.

Kunming Forensic Hospital and Kunming Kidney Disease Hospital share the same group of doctors. The executive director of Kunming Kidney Disease Hospital, Gao Wei also holds positions in Dongguan Taiping People's Hospital and Kunming Forensic Hospital[207]. A summary of Gao Wei's transplant experience is the following: from Jan. 2001 to Dec. 2002, participated in 605 kidney transplants, 43 kidney extractions and 8 combined kidney-liver extractions[208]. From Aug. 2002 to Aug. 2005, participated in 350 kidney transplants, among which 90 combined kidney-liver extractions and 260 kidney extractions[209]. As of April 2008, participated in 1,537 kidney transplants[210].

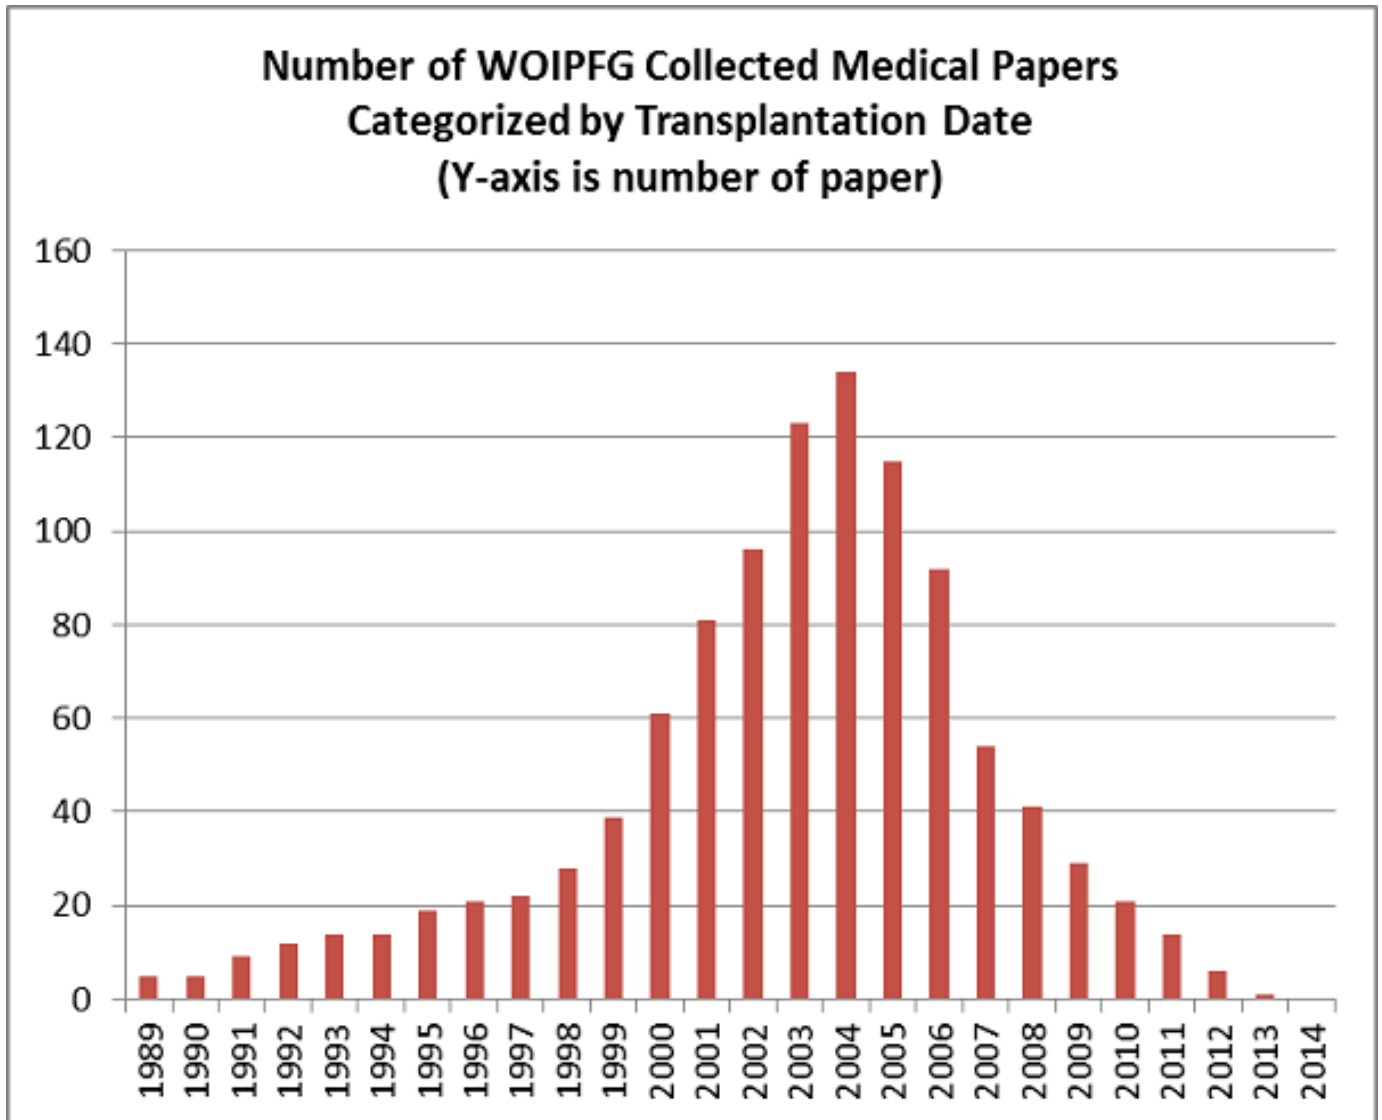

## 8.5 Military and Armed Police Forces Hospitals Have Ample Organs, so Many They Even Provide Organs to Local Hospitals

Beijing Military Region General Hospital Liver Transplant Center started clinical liver transplant since 1999, claiming “liver transplant is a routine operation.” “We have established a fast and well-connected channel to obtain donor livers. We can obtain high quality donor livers not only from Beijing and surrounding areas, but also from other provinces and cities[211].”

On May 15, 2011, director of Guangzhou Air Force Hospital Department of Ophthalmology, Jing Lianxi visited Shanghai Bright Eye Hospital. Jing said that “Guangzhou Air Force Hospital, with our unique advantages, will provide high quality corneas to Shanghai Bright Eye Hospital[212].” The so-called “unique advantages” would be ample high quality corneas. The ophthalmology department of Shenyang Military Region General Hospital has the largest eye bank in the military system and also in the Northeastern region[213]. It claims to have ample donor sources[214]. Shenyang Military Region General Hospital has the biggest number of corneal transplants performed within the Northeastern region. Moreover, it is the only hospital that can provide cornea on demand[215]. In March 2006, Liaoning Provincial Thrombosis Hospital of Integrated Chinese and Western Medicine was exposed internationally for harvesting organs, including corneas, from living Falun Gong practitioners. The regime denied the allegation saying that the hospital was too small and had no ability to perform transplantation. Having no ability to perform transplantation does not mean having no ability to extract organs, including corneas. The hospital is only 30km away from Shenyang Military Region General Hospital.

## 8.6 The Peak of Organ Extractions Coincides with the Peak of the Persecution of Falun Gong

The graph below shows the number of research papers with description of organ extraction taking place in certain time period. For example, over 130 papers mentioned organ extraction procedures took place in 2004.

Even though this is incomplete statistics, it still shows the general trend of rapid increase after 2000, peaking between 2003 and 2005, and rapid decrease after 2006.

The rapid increase of research papers after 2000 coincides with the start of Chinese regime's persecution of Falun Gong. The rapid decrease in research papers after 2006 was very likely caused by the March 2006 exposure in the international community of state-sanctioned live organ harvesting in China. The Chinese regime adapted its live organ harvesting into a more stealthy operation, including silencing medical research papers. Note that the decrease after 2006 is decrease in medical research papers, not decrease in organ transplants performed.

### 8.7 The Case of Weifang City Shandong Province: Intensifying Persecution and Thriving Transplantation Business

The graph below shows the number of research papers, from hospitals in Shandong province, with description of organ extraction taking place in certain time period. There were zero research papers prior to 1999. Since 1999, the number of papers gradually increased. Then around 2002 and 2003 time frame, there was an explosive increase until it reached the peak in 2004. Such increase is implausible unless there was a sudden increase of "donor" organs.

### Number of WOIPFG Collected Medical Papers from Shandong Province Categorized by Transplantation Date (Y-axis is number of papers)

Take a mid-sized city in Shandong province, Weifang city, for example. According to [minghui.org](http://minghui.org), a website documenting firsthand account of the persecution of Falun Gong in China, Weifang ranks number one in the severity of persecution among all mid-sized (prefecture level) cities in China. As of May 2014, there were at least 109 confirmed deaths due to the persecution<sup>[216]</sup>. The chart below shows the number of death per year. The peak happened from 2000 to 2005. Again, this trend coincides with the increasing number of organ extraction papers.

Caption: Number of Deaths by Year of 109 Falun Gong Practitioners Persecuted to Death in Weifang City

### The development of cornea and kidney transplant in 3 Hospitals in Weifang

The ophthalmology department of Weifang Medical College Affiliated Hospital describes its growth on its website: “In 1979, the first formal eye bank was established in Weifang Medical College Affiliated Hospital. It has **completed almost 10,000 corneal transplants**. Through hard work, advertisement, and **support from certain government agencies**, the Hospital was able to broaden its cornea sources[217].”

Based on WOIPFG’s investigation, there are a few hospitals in China who claim to have conducted several thousand corneal transplants, namely, Sun Yat-Sen University Eye Center[218], Qingdao Eye Hospital[219], Shandong Provincial Eye Hospital[220] and Weifang Medical College Affiliated Hospital.

Weifang Rende Hospital specializes in hemodialysis (血液净化) and kidney transplant. It is “the largest kidney disease treatment center in the city and the first to perform HLA testing in Shandong province.” The surgeons established “a **network of organ supply system**[221].” From 1998 to 2004, it has performed over 1000 HLA testing. “Being able to exchange and share matching data made it possible to meet the clinical needs for organs[222].”

Weifang Eye Hospital’s website claims: The corneal disease treatment center has the standard eye bank approved by Shandong provincial Department of Health. Since 1999, several thousand corneal transplants were performed. (The Center) has specialists such as Li Guiren, Zhang Shaobin, Zhang Haorun. Zhang Shaobin has conducted several thousand corneal transplants. Weifang Eye Hospital eye bank was recognized the only standard eye bank in Weifang city by Shandong provincial Department of Health, and can provide ample corneas for patients[223].

To summarize, Weifang Medical College Affiliated Hospital and Weifang Eye Hospital have performed over 10,000 corneal transplants since 1999. The corneas were mostly “fresh” ones. In 5 years’ time since 1999 to 2004, Weifang Rende

Hospital has done over 1,000 cases of HLA testing. Where could a mid-sized city find so many donors? Moreover, all three hospitals mentioned “support and cooperation from certain government agencies,” “broadening the donor organ sources,” “having ample organs,” “establishing a donor supply system,” “sharing with other centers,” etc. With the persecution of Falun Gong became increasingly severe, the number of captive Falun Gong practitioners kept increasing, thus fueling the thriving transplantation industry in Weifang City.

## 9 Transplant Abnormalities Continue in China

After the live organ harvesting was exposed in 2006, the CCP has created a series of measures to conceal the real source of organs. For example, the Ministry of Health has designated specific transplant units, set up an organ donation system, admitted its long-standing use of organs from executed prisoners, guaranteed to not use condemned prisoners’ organs from a certain date onwards, reported organ black market individual cases of arrests, exaggerated the illusion of a rampant organ black market with individual cases, and so on. At the same time, hospitals of different sizes would claim that due to a lack of donors, they have to reduce the number of organ transplants, and so on.

However, the abnormal phenomena in Chinese transplantation industry are still ongoing.

### 9.1 Qingdao University Founded an Organ Transplant Center and “Planned to Complete 100 Operations within the First Year”

In February 2014, the Affiliated Hospital of Qingdao University announced the establishment of an organ transplant center. The hospital’s personnel “travelled to Beijing multiple times to cordially invite” the former deputy director of the Armed Police Forces General Hospital Liver Transplant Institute, Zang Yunjin, to form “a transplant elite team of 20 to 30 people” and to set up “liver transplant, heart transplant, kidney transplant and pancreas transplant sections”. Also, the hospital planned to complete 100 organ transplants within the year” [224]. However, previously, the hospital only carried out 40 kidney transplants and 3 to 5 liver transplants every year; and it was not capable of performing heart transplant operations. If there were no specific organ sources, how could the hospital accomplish its ambitious plan of performing 100 transplants? An article published in August 2014 has proven that the “full confidence” of the Affiliated Hospital of Qingdao University was not empty talk. It was reported that “after the center was established, in less than 6 months, the hospital had carried out 30 liver transplants and 38 kidney transplants, ranking first in the province in terms of the total number of surgeries performed and the operations’ quality was leading in the country.” The report also said, “How big the hearts are, how big the stage is.”

Zang Yunjin serves as the director of the organ transplant center and the director of the liver transplant department. Zhang Bin and Zhang Shun serve as deputy directors of the center and the liver transplant department. The liver transplant team’s other members include Fan Ning, Hu Weiyu, Hu Xiao, Guan He and Wang Xin. The former deputy director of Qianfoshan Hospital’s cardiac surgery department, Li Zhiqiang, is hired as the director of the kidney transplant department. Dong Zhen serves as the deputy director of the kidney transplant department. “Sun Lijiang and Li Yanjiang from the hospital’s urology surgery department, to support the kidney transplant department in achieving a new leap forward, often rushed to Huangdao District in the evenings to assist with the surgeries, after completing their own work. Together with Dong Zhen and Huang Tao, they have set a record of completing 6 surgeries within 24 hours [225]!”

### 9.2 Five donor livers “Simultaneously Arrived” at the Fuzhou General Hospital of Nanjing Military Region; Transplant Operations were Completed within 17 Hours

From 12 a.m. on February 18, 2014 to 4:00 a.m. on February 19, the Fuzhou General Hospital of Nanjing Military Region completed five liver transplants [226].

江艺说，等待移植的5个患者，一直在医院接受治疗并等待合适的肝源，而能给这5个患者肝源，是在这之前就配型完成，但是只能等捐者心脏停跳5分钟后，才能取下来。不过取下来的肝最多只能保存一天，最佳的保存时间是12个小时。

当天，5个肝源是同时送达的，因此这5名患者，必须在肝源送到后马上进行手术。为了保证肝源的活性，也为了这5个患者的手术能够更成功，江艺和他的团队经过深思熟虑的规划后，冒险选择了5台手术同时进行。

“由于手术难度大，风险高，往往一台肝移植手术时间会大大超过常规手术，可达10余小时。”江艺说，一天内做三四台手术平常也都会遇到，但在17个小时短时间内完成5台肝移植手术，他从医20几年来也是第一次遇到过。如果要保证5台手术都能完成，且保证肝最佳活性在12小时内，只能采取“流水线”的轮番操作

There were five patients waiting for livers to arrive in the hospital, and these five livers “had completed the matching process before arriving here, but they could only be harvested five minutes after the donors hearts stop beating.” Obviously, when the matching process was taking place, the five “donors” were still alive, and they were living persons with normal liver functions and a successful organ matching. Therefore, when the patients were at the hospital, instead of waiting for a suitable organ matching, they were waiting for the deaths of the “donors.” It is inconceivable that all five “donors” would have their “hearts stop beating” on the same day, and these five livers would “simultaneously arrive” at the Fuzhou General Hospital of Nanjing Military Region.

Who were these five “donors”? What caused them to die at the same time? This incident occurred in February 2014, clearly showing that amid the international community’s condemnation, while the Chinese Communist Party was promising to stop using the organs from executed prisoners, and denying its organ harvesting practice from living Falun Gong practitioners, at the same time, these premeditated crimes of murdering for organs are still taking place in China, and they were also openly reported by the state-run media.

## Conclusion

After analyzing a group of Chinese medical research papers, this report presents the following conclusions: Almost all organs used for transplantation in mainland China are removed from “brain-dead patients” or patients with “traumatic brain injuries” or persons whose “hearts just stopped beating”. These organs are all considered illegally harvested from living people.

Of the so-called “donors”, who had their organs harvested, more than 90% were healthy young adult men of 20 to 40 years old. During their life time, they were physically fit with properly functioning internal organs; they had no hepatitis B, HIV, syphilis or any other infectious diseases, and no history of alcohol and tobacco use. This group of people supplied organs to the tens of thousands of transplants taking place in mainland China every year. It is absolutely impossible to get these organs from executed prisoners alone. The illegally detained Falun Gong practitioners are the live “donors,” whose organs were taken without consent to support the ever-growing transplant needs.

In mainland China, there is a large living “donor” bank. When a “donor’s” profile matches that of a recipient, the “donor” would be put to death in the process of organ harvesting at a predetermined time. This is the only explanation for the ultra-short wait time for transplant operations, the emergency transplants, and the transplants with preselected dates.

This report analyzes the organ transplant research papers published on Chinese medical journals. The analysis results suggest that a large proportion of the organ “donors” were still alive when their organs were being removed. The research papers’ descriptions of the organ harvesting processes and the numbers of “donors” can at least partially exclude the possibility that some “donors” were executed prisoners. However, the large number of illegally abducted and detained Falun Gong practitioners seem to be the most plausible main source of living “donors.”
